2. Would you mind considering a minor revision of your 2 page bibliography. In my nomination letter, I'm trying to underscore the diverse areas where you've made major contributions, and I think its well known and obvious to many that two of these are instrumental data and paleoclimate reconstructions. But it occurs to me that it is equally important to stress your work in detection of anthropogenic impacts on climate w/ both models and observations. For example, your early Nature papers w/ Wigley. in '80 and '81 seem to be among the earliest efforts to try to do this (though I don't have copies of the papers, so can't read them!), and that seems very much worth highlighting to me. My suggestion is that you add a category on "Anthropogenic Climate Signal" detection and include this work (say, 8 or so of the key papers in this area including the two early Nature one's w/ Wigley) as well as some of your later work w/

Santer/Tett/Thorne/Hegerl/Barnett. I realize that most of your work in this area isn't as primary author, but I do think it would be helpful to show this side of your research, and I'd like to incorporate that into my nomination letter (i.e. how critical your efforts have been to developments in areas such as D&A). You could still fit this onto 2 pages by making the font smaller for the references (10pt rather than 11 pt) while keeping the headings at 11 pt, and if necessary you could probably sacrifice a few of the surface temperature record references to make space for the additional references.

Also, if you happen to have pdfs of the two early Wigley papers, or even just the text for the abstracts, it would be great to have a little more detail about those papers so I can appropriately work them into the narrative of my letter.

thanks for any help,
mike

p.s. please tell Keith I was very sorry he was unable to make it here to Trieste, I was really looking forward to seeing him (as were Ed and many others here). I hope all is well w/ his daughter.

From: Michael Mann To: P.Jones@uea.ac.uk Subject: Re: request for some additional info. Date: Wed, 11 Jun 2008 12:24:41 -0400 Reply-to: mann@psu.edu thanks Phil--yes, that's perfect. I just wanted to have some idea of the paper, that's more than enough info. I wouldn't bother worrying about scanning in, etc. I should have a draft letter for you to comment on within a few days or so, after I return from Trieste, talk to you later, mike [1]P.Jones@uea.ac.uk wrote: Mike, Thanks. The 1980/1981 papers. I don't have the pdfs. 1980: This paper looked (spatially) at temperatures and precipitation for the 5 warmest years during the 20th century and the 5 coldest. We then differenced these to produce what might happen. We expanded this in a DoE Tech Report to look at the warmest/coldest 20-year periods. This latter effort didn't make much difference. 1981: This looked at statistics of annual/winter/summer Temperatures for the NH and zones of the NH to see what signals might you be able to detect. SNR problem really. Showed that best place to detect was NH annual and also Tropics in summer. Last place to look was the Arctic because variability was so high. I did look a while ago to see if Nature had back scanned these papers, but they hadn't. Is the above enough? I have hard copies of these two papers - in Norwich Cheers Phil Hi Phil, thanks---yes, revised bibliography looks great. I'll can send you a copy of my nominating letter for comment/suggestions when done. also--can you provide one or two sentences about the '80 and '81 Nature articles w/ Wigley so that I might be able to work this briefly into the narrative of my letter? thanks, mike [2]P.Jones@uea.ac.uk wrote: Mike. Will this do? Have added in a section on D&A. You didn't send the narrative. Will I have to alter that? Hope to get out of AVL at 5pm tonight - thunderstorms permitting. Cheers Phil HI Phil,

OK--thanks, I'll just go w/ the H=62. That is an impressive number and almost certainly higher than the vast majority of AGU Fellows.

I've attached the 2 page bibliography. I think it would be good to add some some of the more prominent D&A type papers, especially those early ones because they seem to be ahead of their time, and it is a high profile topic (more so than hydrology!). but its your call.

Enjoy Asheville--say hi to Tom for me.

talk to you later,

mike

[4]P.Jones@uea.ac.uk wrote:

Mike,

Off to the US tomorrow for 1.5 days in Asheville.

On 1, this is what people call the H index. I've tried working this out and there is software for it on the web of science.

Problem is my surname. I get a number of 62 if I just use the software, but I have too many papers. I then waded through and deleted those in journals I'd never heard of and got 52. I think this got rid of some biologist from the 1970s/1980s, so go with 52.

I don't have pdfs of the early papers. I won't be able to do anything for a few days either. When do you want this in, by the way? Can you email me the piece I wrote for you, as I don't have this on my lap top. I can then pick it up tomorrow at some airport.

The D&A work has always been with others. There is another area on hydrology that I omitted as well.

Keith's daughter is OK. She had the operation last Tuesday. He should be over in Birmingham this weekend.

Cheers
Phil

Hi Phil,

I'm continuing to work on your nomination package (here in my hotel room in Trieste--the weather isn't any good!). If its possible for a case to be too strong, we may have that here! Lonnie is also confirmed as supporting letter writer, along w/ Kevin, Ben, Tom K, and Jean J. (4 of the 5 are already AGU fellows, which I'm told is important! Surprisingly, Ben is not yet, nor am I. But David Thompson is (quite young for one of these). I'm guessing Mike Wallace and Susan Solomon might have had something to do w/ that ;)

Anyway, I wanted to check w/ you on two things:

1. One thing that people sometimes like to know is the maximum value of "N" where "N" is the number of papers an individual authored/co-authored that have more than N citations. N=40 (i.e., an individual has published at least 40 papers that have each been cited at least 40 times) is supposedly an important threshold for admission in the U.S. National Academy of Sciences. I'm guessing your N is significantly greater than that, and it would be nice to cite that if possible. Would you mind figuring out that number and sending--I think it would be useful is really sealing the case.

2. Would you mind considering a minor revision of your 2 page bibliography. In my nomination letter, I'm trying to underscore the diverse areas where you've made major contributions, and I think its well known and obvious to many that two of these are instrumental data and paleoclimate reconstructions. To the Editor
American Liberty Publishers
Minneapolis, MN 55418

Dear Sir,

Your website (http://www.amlibpub.com/top/contact_us.html) was recently brought to my attention. On this site, you make the following claims:

"In the Second Assessment Report, Benjamin Santer, lead author of a crucial study, falsified a chart to make it appear to support global warming—a conclusion not supported at all by the original data. But two climatologists, Knappenberger and Michaels, looked up the data and exposed the fraud. Santer said he adjusted the data to make it agree with political policy."

These claims have no factual basis whatsoever, and are demonstrably libelous. I did not falsify data. I did not commit fraud. I did not - nor have I ever - "adjusted" scientific data "to make it agree with political policy." Nor did I ever state that I had made data adjustments in order to conform to political policy.

I request that you retract these claims immediately. They are completely fictitious, and are harmful to my scientific reputation. If you do not retract these claims immediately, I will transfer this matter to the attention of legal staff at Lawrence Livermore National Laboratory.

Sincerely,

Dr. Benjamin Santer

Caspar

I have been of the opinion right from the start of these FOI requests, that our private , inter-collegial discussion is just that - PRIVATE . Your communication with individual colleagues was on the same basis as that for any other person and it discredits the IPCC process not one iota not to reveal the details. On the contrary, submitting to these "demands" undermines the wider scientific expectation of personal confidentiality . It is for this reason , and not because we have or have not got anything to hide, that I believe none of us should submit to these "requests". Best wishes

Keith

At 09:01 23/06/2008, Tim Osborn wrote:

Hi Caspar,

I've just had a quick look at CA. They seem to think that somehow it is an advantage to send material outside the formal review process. But **anybody** could have emailed us directly. It is in fact a disadvantage! If it is outside the formal process then we could simply ignore it, whereas formal comments had to be formally considered. Strange that they don't realise this and instead argue for some secret conspiracy that they are excluded from!

I'm not even sure if you sent me or Keith anything, despite McIntyre's conviction! But I'd ignore this guy's request anyway. If we aren't consistent in keeping our discussions out of the public domain, then it might be argued that none of them can be kept private. Apparently, consistency of our actions is important.

Best wishes

Tim

So is this.

Have a look at Climate Audit. Holland has put all the responses and letters up.

There are three threads - two beginning with Fortress and a third later one.

Worth saving the comments on a Jim Edwards - can you do this Tim?

I've saved all three threads as they now stand. No time to read all the comments, but I did note in "Fortress Met Office" that someone has provided a link to a website that helps you to submit FOI requests to UK public institutions, and subsequently someone has made a further FOI request to Met Office and someone else made one to DEFRA. If it turns into an organised campaign designed more to inconvenience us than to obtain useful information, then we may be able to decline all related requests without spending ages on considering them. Worth looking out for evidence of such an organised campaign.

Tim

Andy
Here's some further results, based on the time series for 1900 to 2007

Results:

- (0) correlation between ENSO and PDO: for the smoothed IPCC decadal filter: 0.490662
- (0) correlation between ENSO and PDO: for the annual means: 0.527169
- (0) regression coef for PDO with global T : 0.0473447
- (0) regression coef for N34 with global T : 0.0664886

Data sources:

```
-----  
: PDO: http://www.jisao.washington.edu/pdo/  
: http://jisao.washington.edu/pdo/PDO.latest  
-----  
: N34: http://www.cgd.ucar.edu/cas/catalog/climind/Nino_3_3.4_indices.html  
: http://www.cgd.ucar.edu/cas/catalog/climind/TNI_N34/index.html#Sec5  
-----  
: CRU: http://www.cru.uea.ac.uk/cru/data/temperature/  
: Hadcrut: http://www.cru.uea.ac.uk/cru/data/temperature/hadcrut3vgl.txt  
=====
```

: Files were manually stripped for 1900 to 2007
:=====

These numbers mean that for a one standard deviation in the ENSO index there is 0.066C change in global T, or from PDO: 0.047C, but that much of the latter comes from the ENSO index. Very roughly, since the correlation is 0.5 between PDO and ENSO, half of the 0.066 or 0.033C of the 0.047 is from ENSO. Strictly one should do this properly using screening regression.

Dear Phil,

The wedding was really very moving and beautiful. I had a great time. I'm sending along a picture of Tom and Helen which was taken at Granite Island (near Victor Harbor). I don't know whether I've ever seen Tom as happy as he is now...

Myles (if it is Myles) was a bit pedantic in his second review. Karl (who is a very-mild-mannered guy) described the tone of the review as "whining". It seems like the Reviewer was saying, "I'm a lot smarter than you, and I could do all of this stuff much better than you've done". I was very unhappy about the "wilfully ignoring" bit. That was completely uncalled for.

Have a great time at Lake Constance, Phil. It's a beautiful part of the world.

Best regards, and best wishes to Ruth,

Ben

Dear Glenn,

I thought you might be interested in this email exchange with Francis Zwiers. It's directly relevant to the third criticism raised by Reviewer 2.

With best regards,

Ben

To: Zwiers,Francis [Ontario]
Subject: Re: [Fwd: JOC-08-0098.R1 - Decision on Manuscript]

Dear Francis,

Thanks - this information will be extremely helpful in responding to Reviewer 2. I really do feel that the Reviewer is getting overly exercised about a relatively minor technical point. As you note, the key issue is that, in terms of the statistical significance testing, we are making it easier to get a "Douglass-like" result by using an AR-1 model for calculating the adjusted standard errors.

I'm concerned that going down the road proposed by Reviewer 2 could leave us open to unjustified criticism. It would be a shame if Douglass et al. argued (erroneously) that our failure to find significant differences between modelled and observed trends was spurious, and arose primarily from use of higher-order autoregressive models for calculating the adjusted standard errors.

Would it be o.k. to share your email with Glenn McGregor and with my other coauthors on the paper? Since you've looked at these issues in detail in your previous papers with Thiebaut and with Hans, your comments would be very useful background information for Glenn.

With best regards,

Ben

Subject: Re: A long and rocky road...
Date: Tue Jul 22 15:12:59 2008

Dear Ben,

well, thanks for your thanks. I'm not sure that I did all that much, but glad that the small amount is appreciated. It's a shame that the process couldn't have been quicker still, but hopefully the final production stage will pass smoothly.

Thanks for the copy of the paper, which I've skim read already -- looks very carefully done and therefore convincing (I'm sure you already heard that from others).

I note that you also provide some supporting online material (SOM). Provision of SOM is a relatively new facility for IJoC to offer and it may be suffering from teething problems.

A paper of mine (Maraun et al.) that appeared online in IJoC back in February still has its SOM missing! Hopefully this is a one-off omission, but I'll now email Glenn to remind him of this in relation to my paper and also point out that your paper has SOM. I think this is a problem on the publisher's side of things rather than an editorial problem.

Because of our absent SOM, we've temporarily posted a copy of the SOM on our personal website. If your SOM was delayed, and if you think that critics might complain if the paper appears without the SOM, you might want to post a copy of the SOM on your own website when the paper appears online. But hopefully there'll be no problem with it!

I heard you had a recent trip to Australia for Tom's wedding -- hope that was fun!

Best regards

Tim

At 22:28 21/07/2008, you wrote:

Dear Tim,

Our response to the Douglass et al. IJoC paper has now been formally accepted, and is "in press" at IJoC. I've appended a copy of the final version of the manuscript. It's been a long and rocky road, and I'll be quite glad if I never have to write another MSU paper again - ever!

I'd be grateful if you handled the paper in confidence at present. Since IJoC now has online publication, we're hoping that the paper will appear in the next 4-6 weeks.

Hope you are well, Tim. Thanks for all your help with the tricky job of brokering the submission of the paper to IJoC.

With best regards,

Ben

Dear Jason and Jerry (and Karl and Ron)--One of my suggestions on an
earlier round was such a simulation--to determine how models might do and
compare with a declining concentration (optimistic as such a scenario
might
be). The one you are doing would seem to have an overshoot on the
forcing,
but probably not (or not much) on the global average temperature due to
lag
effects in the system. It seems to me it would be worthwhile figuring out
such a run that also got the temperature decreasing, so maybe returned to
below the equivalent concentration we have now (so below something like
375
ppm when counting aerosol effects). In that such scenarios would likely
lead
to sharp cuts in CO2 emissions, they would also presumably lead to sharp
reductions in the SO2/SO4 offset, we are really already at about 450 ppm
CO2
equivalent for GHGs alone--and so to really get cooling started, the run
would likely have to go back to 350 ppm or below--so basically to the
level
Jim Hansen has been arguing is required to get back near 1990s climatic
conditions.

I would also note that the CO2 equivalence calculations are being done
using
the 100-year GWPs. While there is not much difference for N2O and most
halocarbons, the 20-year GWP for methane is about 3 times the 100-year
value
and so over the near-term methane changes (from stringent methane
control,
or additional release from thawing tundra) could have a very large effect
on
the short-term forcing and so on temperature change over the next several
decades, so when the peak occurs and how one comes back thereafter. While
CO2 control may well take time, methane control is very cost effective
and
should be being pushed very hard as a strategy (along with soot and air
pollutants contributing to tropospheric ozone--a point made several years
ago by Jim Hansen). In any case, it seems to me it is not implausible to
imagine that we could get to conditions where radiative forcing is coming
down, and that type of run needs to be explored--so having some sort of
standard run that groups could try if they have resources would make good
sense.

Phil,
Thanks for this.

In response:

1. I can't remember the thinking behind this - can you?
2. I don't think we'll be doing anything with UKCIP08 material, or briefing people; initially at least it will be about user needs without people thinking about how they might use UKCIP08, if that makes sense!
3. This is fine, although we may want some consistency between us e.g. Newcastle rates have been revised and are substantially larger than yours.
4. We need a pen portrait for Tim.
5. Thanks - we'll use this in with the other text.

Best wishes,
Geoff

Subject: Re: EA 21389 - Probabilistic information to inform EA decision making on climate change impacts - PCC(08)01

Geoff,

Clare is off to Chelsea - back late tomorrow. We (Clare, Tim and me) have had a brief meeting. Here are some thoughts and questions we had.

1. Were we going to do two sets of costings?
2. Those involved in UKCIP08 (both doing the work and involved in the SG) have signed confidentiality texts with DEFRA. Not sure how these affect access to the headline messages in the drafts we're going to be looking at over the next few months. Also not sure how these will affect the UKCIP workshops that are coming up before the launch.
3. We then thought about costs for the CRU work. We decided on 25K for all CRU work. At £500 per day this comes to 50 days. We then split this into the tasks: 5 - 5 days, 6 - 5 days, 7 - 30 days, 10/11 - 5 days, which leaves 5 more days for meetings. Assumed the 25K was without travel to the meetings.
4. On CVs and pen portraits. Clare will send one before she leaves. Are what you have for Tim and me OK?
5. Some thoughts on Tasks 6 and 7
Task 6 - assumed this was mostly Newcastle.

Tim's work on rainfall extremes could be

fed in, and we can do something on non-rainfall variables. Assume also you expect us to

do waves, but not sure what we can do. It seems as though sea level has become waves?

Task 7 - assumed here Newcastle (Chris/Hayley) would be doing something on blocking (large-scale variability). Oxford would do the final bit on conceptual representation

of emissions and climate system and sensitivities, so based on GCMs.

This leaves CRU for the other three, which we base mainly on the 11 RCM runs, which we can access through LINK. We could also use ENSEMBLES runs for the others, but these would be RCMs. They seem more relevant for the sorts of scales UKCOP08 is working at.

All just a few thoughts at this time.

Can you send the UKWIR bid that went off, so we have a copy?

Cheers

Phil

From: Phil Jones <p.jones@uea.ac.uk>
To: Gavin Schmidt <gschmidt@giss.nasa.gov>
Subject: Re: Revised version the Wengen paper
Date: Wed Aug 20 09:32:52 2008
Cc: Michael Mann <mann@meteo.psu.edu>

Gavin,

Almost all have gone in. Have sent an email to Janice re the regional freshening. On the boreholes I've used mostly Mike's revised text, with bits of yours making it read a little better.

Thinking about the final bit for the Appendix. Keith should be in later, so I'll check with him - and look at that vineyard book. I did rephrase the bit about the 'evidence' as Lamb refers to it. I wanted to use his phrasing - he used this word several times in these various papers. What he means is his mind and its inherent bias(es).

Your final sentence though about improvements in reviewing and traceability is a bit of a hostage to fortune. The skeptics will try to hang on to something, but I don't want to give them something clearly tangible.

Keith/Tim still getting FOI requests as well as MOHC and Reading. All our FOI officers have been in discussions and are now using the same exceptions not to respond - advice they got from the Information Commissioner. As an aside and just between us, it seems that Brian Hoskins has withdrawn himself from the WG1 Lead nominations. It seems he doesn't want to have to deal with this hassle.

The FOI line we're all using is this. IPCC is exempt from any countries FOI - the skeptics have been told this. Even though we (MOHC, CRU/UEA) possibly hold relevant info the IPCC is not part our remit (mission statement, aims etc) therefore we don't have an obligation to pass it on.

Cheers

Phil

At 18:07 19/08/2008, you wrote:

Phil, here are some edits - mostly language, a couple of bits of logic, an attempt to soothe Mike on the borehole bit, and a paragraph for consideration in the Appendix. Two questions require a little thinking - the reference to 'regional freshening' on the coral section needs to be more specific - I doubt it is a global phenomena, second there is an 'in prep' reference to some new work by van Ommen - I don't think this is appropriate and should either be removed and put as a personal communication.

Having looked over the tropical trees section, I think that's fine.

The fig A1 does need labelling though.

Thanks Tim! We'll have another round later, confirmed by Tim, when we discuss storage and documentation - probably should try before WGCM meeting so that David can present results.

the 'near term prediction' is a mip all by itself, so there will be some guidance coming up hopefully!

In terms of ensemble size: for the stuff I was involved in, even one run from a model was good since it increased the overall ensemble size for multi model means and estimates of variance - did you analyze models individually? I would be keen to hear from the group:

is say a single 20th c run, single natural only run, single ghg run
a) useless
b) much better than nothing?

| vouch for b) for things I was involved in but it would be good to know for which applications its a!

Caspar,
Thanks.

Phil

At 14:16 27/08/2008, Caspar Ammann wrote:

Phil,
I worked on the figures yesterday and sent them off to Gene for double check. Will be one panel each (6), much improved legibility and significantly reduced "footprint" in the appearance of the text. You should have them before the end of your day.
Thanks for all your work on this paper! (Tim too!)

Cheers,
Caspar

On Aug 27, 2008, at 2:42 AM, Phil Jones wrote:

Caspar, Gene,

We're going to send the manuscript back tomorrow. If we get a revised diagram we'll include - otherwise we won't.

Have had a few more comments, but nothing substantial. All yours Gene are in, as are those from Gavin, Mike, Juerg and the coral people. There is a completely revised tropical dendro section and Peck finally came through with a section on less-resolved proxies and varves.

All in all it reads very well and the recommendations should prove very useful for PAGES.

Cheers
Phil

At 04:52 26/08/2008, Caspar Ammann wrote:

Hey Gene,
I'll see how I can adjust the figures to fit.

Caspar

On Aug 25, 2008, at 8:30 PM, Eugene Wahl wrote:

Hi Phil and Tim, and Caspar:

Here are my full set of comments on the entirety of section 3, the figures relevant to section 3, the authors' address, and abstract (none there). I made slight changes in the portion of the text already sent last night, sorry that I could not avoid that!

Caspar, please note that I've operated here on the assumption that Figure 3 is simplified to one panel for each section, according to the suggestions we have talked

about, but does contain all 6 portions, A-F.

There are two versions: one with just the relevant portions of the text, and the full amended text document. The changes noted should be identical in each version.

Gene,

Thanks. Today is a holiday here. We'll all be back in CRU tomorrow. So, we'll begin revising Section 3 then. Have had quite a few comments so far, and all are in.

New Figure 3 most appreciated. We must send this off on Thursday or Friday.

Hope you're settling in to Boulder life. At least you should be able to contact Caspar more easily!

Cheers

Phil

----- Original Message -----

Subject: New Wengen Draft

From: [3]Eugene.R.Wahl@noaa.gov

Date: Mon, August 25, 2008 2:45 am

To: [4]p.jones@uea.ac.uk

Hi Phil:

I've had to wait to the weekend to get to this, due to several other matters that had to be attended to here at NOAA this week and in relation to a report required by a funder that was due Friday.

I've looked over about half of section 3 (up to the start of section 3.4.2), and also the abstract and the authors' address section.

Attached are my comments on those sections. I will be getting to the rest of section 3 tonight and tomorrow and will send anything else to you. Everything is done in WORD with "Track Changes" turned on.

HIGHLIGHTS

1) My address information has been updated to include my NOAA information, which is now appropriate. The original Alfred information is kept, as also appropriate. I've condensed it all to not change the overall page spacing of the address citations.

2) The addition to the results description of the Riedwyl et al.

(2008) paper across pp 10-11 here (near the top of p 56 in the text you

sent this week). It is NECESSARY to keep this addition, as the text as it was "overemphasized" the differential quality of the RegEM results in this study. Their graphs 4 and 6 clearly show the results I added, in which RegEM for winter adds quite problematic artifacts at the highest levels of noise added. The white-noise SNR at which this happens (0.25), while low, is not outside of what reality might bring. [NB: I have talked with Juerg about this situation, and he is clearly aware of my sense that RegEM is given too high marks in this context.]

3) I added very brief descriptions how the CFRs actually come up with a reconstruction to the descriptions of them in section 3.2. If you feel these three sentences cannot be included I understand, but I think they are useful for the readers to know HOW the covariance information we are talking about there is actually used.

TO COME: Caspar and I are working out a much simplified version of Figure 3 (one panel per each section A-F), which I think will be much better than what is there now. We communicated on that Friday and yesterday, and are now close to having a new graphic. I will adapt the references to Figure 3 in section 3.4.2 and in the figure caption in my next message accordingly, which I plan will come either tonight or tomorrow.

Peace, and again thanks!

Gene

From: From Phil Jones New Wengen Draft

Dear All,

Here's the revised version of the paper, together with the responses to the reviewers.

We have told John Matthews, that we will get this back to him by the beginning

of next week. To us in the UK this means Aug 26/27 as next

Monday

is a national

holiday. So, to those not away at the moment, can you look

through

your

parts and get any comments back to us by the end of this week or

over

the

weekend?

Can you also look at the references - those in yellow and let

me

know of

any that have come out, or are able to correct those that I

think

just look
wrong?

I hope you'll think of this as an improvement.

Cheers

Phil

yeah, its statistically real, but an artifact almost certainly of natural variability. As Josh Willis nicely pointed out in a recent interview, anyone citing this as a reason to doubt the reality of anthropogenic climate change is like a vegas roller thinking he can beat the system because he's on a momentary winning streak...

Wibjorn,

I'm in Athens at the moment. Unless you're referring specifically to the Arctic the temperature curves in IPCC Ch 3 all include the oceans.

Fennoscandia is just a small part of the NH. When I'm back next week, I'll be able to calculate the boxes that encompass Fennoscandia, so you can compare with this region. As you're aware Anders did lots of the update work in 2001-2002 and he included all the NORDKLIM data. I can send you a list of the Fennoscandian data if you want - either the sites used or their data as well.

I guess your attachments are in your direct email, which I come to later.

One final thing - we are getting SST data in from some of the new sea-ice free parts of the Arctic. We are not using these as we've yet to figure out how to as we don't have normals for these 'mostly covered by sea ice in the 1961-90' areas.

Cheers

Phil

Dear all

Jacque had sounded very positive about this back in August, but it sounds like CSERGE are as stretched as much as people in CRU.

I'm afraid it's looking like we're not going to be able to get anything together on this unless Rob is able to take a lead. But I think that we would still be lacking the interdisciplinary research team that AXA are stressing.

Clare

PS Rob - sorry not to have been in touch with you sooner about this, but I didn't know until Tuesday that you were interested/had been approached.

Subject: RE: AXA Research Fund: launch of a new call for projects

Dear Jacquie

I'm afraid that I've not had time to do anything about this call since returning from holiday. The deadline is rapidly approaching - 3 October and after this week, I'm away at meetings until after the deadline. I also have two ARCC proposals and a DCMS tender to get sorted out this week.

So, I am not going to be able to take any kind of a lead on this even if we think its worth trying to get a last minute proposal together. No-one else from CRU has time to take a leading role, but Colin and Maureen are interested. Colin has been working on the CRU weather generator which will be an integral part of the UKCIP08 user interface and

Maureen has a broader impacts perspective and is lead author on the climate chapter in the forthcoming CII report. Simon Busby might also be interested - and has good experience of working with climate model outputs (although for a rather different purpose). One task for CRU would be to extend some of the validation work of the ENSEMBLES RCM runs. I should also be able to read and comment on material and provide some short draft sections of text (e.g., on ENSEMBLES, PRUDENCE, MICE and STARDEX) - I will have at least sporadic email access while away I hope.

But I think this is only going to be viable if somebody from CSERGE or the decision-making group is able to co-ordinate things. And we don't have the capacity for hydrological modelling in CRU - so again, this would need input from others. Though there is also the requirement in the call to assess the quality of flood modelling tools currently licensed by insurers - about which I know nothing. If it would be helpful to have a quick meeting this week, let me know.

Best wishes, Clare

At 16:30 12/08/2008, you wrote:

Dear Clare,

Many thanks for this I think it would be an excellent opportunity for a CRU + other parts of the School response. I know Jan Alexander has already got a European bid through to second stage on floods. We could certainly put something together with the environmental decision-making components too. Lets discuss when you get back from holiday.

Best wishes

Jacquie

Subject: Fwd: AXA Research Fund: launch of a new call for projects

Dear Jacquie

CRU is interested in putting in a proposal under this call. As you can see, as well as the climate science aspects, there is also a need to work on economic issues - so this could be a good opportunity for putting in a joint proposal with people in CSERGE or other parts of ENV. There are also additional collaborators on the climate and flooding aspects that we could involve both in the UK and Germany.

I'm away from tomorrow for a couple of weeks, but the CRU people copied in on this email are also all interested in a potential proposal. Though currently we're not sure which if any of us has time to lead on this at least immediately.

Best wishes, Clare

Hello Clare,

AXA recently launched a call for projects to academic institutions focused on the flooding risk and the impacts of climate change. The Climatic Research Unit may have been approached with the email reproduced below, and I just wanted to make sure you received the information.

Sincerely Yours,

Mathieu Choux

Dear Madam/Sir,

The AXA Research Fund has been created in order to encourage research in a number of disciplines that touch on the risks, challenges and major transformations that affect our rapidly changing world. The Fund will award 100 million Euros over five years to finance innovative research.

The AXA Research Fund team is delighted to announce the launch of a new call for projects on climate change impacts on the risk of flooding in <?xml:namespace prefix = st1 ns = "urn:schemas-microsoft-com:office:smarts" />Europe (see attached document) .

All the information needed to apply can be found on our internet site:

[6]<http://researchfund.axa.com/en/research-funding/calls-projects/>

Please make sure this information is communicated within your institution. The results of the selection process will be communicated to them as of January 15, 2009 .

Sincerely,

The AXA Research Fund Team

Subject: Re: Status of IJoC manuscript
Date: Fri Sep 19 15:11:41 2008

Ben,

Good news. Endnote types is a much better option than in the text - not as good as footnotes.

Yes the paper you attached does look crap. I will read it though even if the journal is even worse.

This paper has come out. The plot of London and Vienna temps, although an aside, is something I need to follow up more. London has a UHI, but it doesn't mean any more warming in the 20th century!

Hope all is well with you.

Cheers

Phil

PS Attached another paper - has some nice photos!

At 17:12 18/09/2008, you wrote:

Dear folks,

I just wanted to give you a brief update on the status of our IJoC manuscript.

I received the page proofs about three weeks ago. Unfortunately, IJoC did not allow us to employ footnotes. You may recall that we made liberal use of footnotes in order to present technical information that would have interfered with the "flow" of the main text. The IJoC copy editors simply folded all footnotes into the main text. This was done without any regard for context. It made the main text very difficult to read. After lengthy negotiations with IJoC editors, we decided on a compromise solution. While IJoC was unwilling to accept footnotes (for reasons that are still unclear to me), they did agree to accept endnotes. The footnotes have now been transferred to an Appendix 2 entitled "Technical Notes". While this is not an optimal solution, it's a heck of a lot better than IJoC's original "assimilate in main text" solution.

Now that the footnote issue has been resolved, I'm hoping that online publication of our paper will happen within the next several weeks. I'll let you know as soon as I receive a publication date from IJoC. LLNL (and probably NOAA, too) will be working on press releases for the paper. I'll also be drafting a one-page, plain English "fact sheet", which will address why we initiated this study, what we learned, why I'll never do this again, etc. I'll circulate this fact sheet for your comments early next week.

With best regards,

Ben

(P.S.: David Douglass and John Christy continue to publish crappy papers. For their

latest science fiction, please see:

Hi Phil

Thanks for the comments on the Briefing report. You say "There is no evidence with London of any change in the amount of the UHI over the last 40 years. The UHI is clear, but it's not getting any worse" and sent a paper to show this. By coincidence I also got recently a paper from Rob which says "London's UHI has indeed become more intense since the 1960s esp during spring and summer". Its not something I need to sort out for UKCIP08, but I thought you both might like to be aware of each others findings. I didn't keep a copy of Rob's PDF after I printed it off but I am sure you can swap papers. I don't need to be copied in to any discussion.

Cheers
Geoff

<x-flowed>

Dear folks,

Here is the next version of the press release for our IJoC paper. I received a number of comments from you (many thanks!), and have tried hard to incorporate them without increasing the length of the release.

Peter Thorne suggested that it might be useful to delete the explicit reference to the UR/UAH group, and instead refer to the Douglass et al. IJoC paper in a footnote. After some internal debate, I have not done that. Anne Stark advised me that footnotes are not often used in press releases (they tend to get ignored by reporters). Furthermore, I couldn't see an easy way of getting rid of the "UR/UAH" acronym, yet still making a clear distinction between their results and our results, their test and our test, etc., etc.

I've tried to capture the spirit if not the letter of your suggested edits. Unfortunately, I don't think we have the time to iterate for days on the press release - we really need to finalize this tomorrow. We will have a little more time to finalize the "fact sheet".

So please let me know as soon as possible if there's anything you can't live with in the press release.

One final point. Peter also asked whether it might be useful to include the telephone numbers of co-authors in the final paragraph of the press release. Anne and I would prefer not to do that. If you are agreeable to fielding press inquiries about the paper, please let me know, and send me a telephone number under which you can be reached in the next few days. We'll then compile a list (with contact information) of co-authors willing to discuss the paper with interested reporters.

I hope to send you a revised version of the fact sheet later tomorrow.

With best regards,

Ben

have not been approached - but I think it really
does sound like the sort of initiative CRU/ENV are looking for.

I get the feeling this is the sort of potential
contact ENV would wish to take over.

Prof. Douglass,

You have access to EXACTLY THE SAME radiosonde data that we used in our recently-published paper in the International Journal of Climatology (IJoC). You are perfectly within your rights to verify the calculations we performed with those radiosonde data. You are welcome to do so.

We used the IUK radiosonde data (the data mentioned in your email) to calculate zonal-mean temperature changes at different atmospheric levels. You should have no problem in replicating our calculation of zonal means. You can compare your results directly with those displayed in Figure 6 of our paper. You do not need our "numerical quantities" in order to determine whether we have correctly calculated zonal-mean trends, and whether the IUK data show tropospheric amplification of surface temperature changes.

Similarly, you should have no problem in replicating our calculation of "synthetic" MSU temperatures from radiosonde data. Algorithms for calculating synthetic MSU temperatures have been published by ourselves and others in the peer-reviewed literature. You have already demonstrated (in your own IJoC paper of 2007) that you are capable of computing synthetic MSU temperatures from climate model output. Furthermore, I note that in your 2007 IJoC paper, you have already successfully replicated our "model average" synthetic MSU temperature trends (which were published in the Karl et al., 2006 CCSP Report).

In summary, you have access to the same model and observational data that we used in our 2008 IJoC paper. You have all the information that you require in order to determine whether the conclusions reached in our IJoC paper are sound or unsound.

You are quick to threaten your intent to file formal complaints against me "with the journal and other scientific bodies". If I were you, Dr. Douglass, I would instead focus my energies on rectifying the serious error in the "robust statistical test" that you applied to compare modeled and observed temperature trends.

I am copying this email to all co-authors of the 2008 Santer et al. IJoC paper, as well as to Professor Glenn McGregor at IJoC. They deserve to be fully apprised of your threat to file formal complaints.

Please do not communicate with me in the future.

Ben Santer

Hi all, I assume this is general interest, not IDAG meeting - I think the meeting would be a bit too big and complicated if we would try to resolve IPCC type issues - on the other hand, involving Chris Field and maybe Tom Stocker may be an interesting way to vent the scientific issues in a relaxed setting. But I would suggest to avoid agency type things - can be convinced otherwise if you feel strongly. we do have a limited budget, too!

Subject: Re: Why are the temperature data from Hadley different from NASA?
Date: Thu, 16 Oct 2008 13:00:59 -0400
Cc: Judith Lean <jlean@ssd5.nrl.navy.mil>, Yousif K Kharaka <ykharaka@usgs.gov>

thanks Phil--this all makes sense. I'll be intrigued to hear more about how the melting sea ice issue is going to be dealt with. no question there is a lot of warming going on up there.

hope to see you one of these days,

mike

On Oct 16, 2008, at 6:52 AM, Phil Jones wrote:

Hi Mike, Judith and Yousif,

Mike has basically answered the question. The GISS group average surface T data into 80 equal area boxes across the world. The UK group (CRU/MOHC) grid the data into 5 by 5 degree lat/long boxes, as does NCDC. These griddings don't allow so much extrapolation of data - no extrapolation beyond the small grid box. The US groups also calculate the globe as one domain, whereas we in the UK use (NH+SH)/2. This also makes some difference as most of the missing areas are in the SH, and currently the NH is warmer than the SH with respect to 1961-90. Our rationale for doing what we do is that it is better to estimate the missing areas of the SH (which we do by tacitly assuming they are the average of the rest of the SH) from the rest of the SH as opposed to the rest of the world.

The Arctic is a problem now. With less sea ice, we are getting SST data in for regions for which we have no 1961-90 averages - because it used to sea ice (so had no measurements).

We are not using any of the SST from the central Arctic in summer.

So we are probably underestimating temperatures in the recent few years. We're working on what we can do about this. There are also more general SST issues in recent years. In 1990, for example, almost all SST values came from ships. By 2000 there were about 20% from Buoys and Drifters, but by 2008 this percentage is about 85%. We're also doing comparisons of the drifters with the ships where both are plentiful, as it is likely that drifters measure a tenth of one degree C cooler than ships, and the 1961-90 period is ship-based average.

New version of the dataset coming in summer 2009.

All the skeptics look at the land data to explain differences between datasets and say urbanization is responsible for some or all of the warming. The real problem is the marine data at the moment.

Attaching a recent paper on urbanization and effects in China.

Cheers

Phil

At 22:08 15/10/2008, Michael Mann wrote:

Hi Judith,

Its nice to hear from you, been too long (several years??). My understanding is that

the differences arise largely from how missing data are dealt with. For example, in Jim et al's record the sparse available arctic data are interpolated over large regions, whereas Phil and co. either use the available samples or in other versions (e.g. Brohan et al) use optimal interpolation techniques. The bottom line is that Hansen et al '05 I believe weights the high-latitude warming quite a bit more, which is why he gets a warmer '05, while Phil and co find '98 to be warmer.

But Phil can certainly provide a more informed and complete answer!

mike

p.s. see you at AGU this year??

On Oct 15, 2008, at 5:03 PM, Judith Lean wrote:

Hi Yousif,

Many apologies for not replying sooner to your email - but I've only just returned from travel and am still catching up with email.

Unfortunately, I am simply a "user" of the surface temperature data record and not an expert at all, so cannot help you understand the specific issues of the analysis of the various stations that produce the differences that you identify. I too would like to know the reason for the differences.

Fortunately, there are experts who can tell us, and I am copying this email to Mike Mann and Phil Jones who are such experts.

Mike and Phil (hi! hope you are both well!), can you please, please help us to understand these differences that Yousif points out in the GISS and Hadley Center surface temperature records (see two attached articles).

Many thanks, for even a brief answer, or some reference.

Judith

On Oct 8, 2008, at 1:50 PM, Yousif K Kharaka wrote:

Judith:

I hope you are doing well (these days OK would be good!) at work and personally.

Can you help me to understand the huge discrepancy (see below) between the temperature data from the Hadley Center and GISS? Any simple explanations, or references that I can read on this topic? I certainly would appreciate your help on this.

Best regards. Yousif Kharaka

Subject

Why are the temperature data from Hadley different from NASA? [18]Link

David and all:

One advantage (or great disadvantage if you are very busy!) of membership in GCCC is that you are forced to investigate topics outside your areas of expertise. For some time now, I have been puzzled as to why global temperature data from the British Hadley Centre are different from those reported by NASA GISS, especially in the last 10 years. GISS reports that 2005 was the warmest year (see first attachment) on record, and that 2007 tied 1998 for the second place. The Hadley group continues reporting 1998 (a strong El Nino year) as having the highest global temperature, and then showing temperature decreases thereafter. The two groups report their temperatures relative to different time intervals (1951-1980 for GISS; 1961-1990 for Hadley), but much more important is the fact that GISS data include temperatures from the heating Arctic that are excluded by others (see second attachment). If you are interested in the topic of sun spots, the 11-year irradiance cycle, and solar forcing versus AGHGs, see the first attachment for what NASA has to say.

We may need help on this complex topic from a "true climate scientists", such as Judith Lean!

Yeah, it wasn't so much 1998 and all that that I was concerned about, used to dealing with that, but the possibility that we might be going through a longer - 10 year - period of relatively stable temperatures beyond what you might expect from La Nina etc.

Speculation, but if I see this as a possibility then others might also. Anyway, I'll maybe cut the last few points off the filtered curve before I give the talk again as that's trending down as a result of the end effects and the recent cold-ish years.

Enjoy Iceland and pass on my best wishes to Astrid.

Mick

To: santer1@llnl.gov
Subject: Re: End of the road...
Date: Mon Oct 27 16:42:01 2008

Ben,

It seems that Climate Audit has been discussing the paper. I had a look whilst I was in Iceland as I had nothing better to do a few times. It was cold and snowy outside, there was internet.....

Seems as though they are making some poor assumptions; someone is trying to defend us, but gets rounded upon and one of the co-authors on the paper is in touch with McIntyre.

As it isn't me, and I can rule out a number of the others, my list of who it might be isn't that long....

Looking forward to next week !!

Cheers

Phil

<x-flowed>

Dear Gavin,

There is no typo in equation 12. The first term under the square root in equation 12 is a standard estimate of the variance of a sample mean (see, e.g., "Statistical Analysis in Climate Research", Zwiers and Storch, their equation 5.24, page 86). The second term under the square root sign is a very different beast - an estimate of the variance of the observed trend. As we point out, our $d1^*$ test is very similar to a standard Student's t-test of differences in means (which involves, in its denominator, the square root of two pooled sample variances).

In testing the statistical significance of differences between the model average trend and a single observed trend, Douglass et al. were wrong to use σ_{SE} as the sole measure of trend uncertainty in their statistical test. Their test assumes that the model trend is uncertain, but that the observed trend is perfectly-known. The observed trend is not a "mean" quantity; it is NOT perfectly-known. Douglass et al. made a demonstrably false assumption.

Bottom line: σ_{SE} is a standard estimate of the uncertainty in a sample mean - which is why we use it to characterize uncertainty in the estimate of the model average trend in equation 12. It is NOT appropriate to use σ_{SE} as the basis for a statistical test between two uncertain quantities (see our comments in our point #3, immediately before equation 12). The uncertainty in the estimates of both modeled AND observed trend needs to be explicitly incorporated in the design of any statistical test comparing modeled and observed trends. Douglass et al. incorrectly ignored uncertainties in observed trends.

Our Figure 6A is not a statistical test. It does not show the standard errors in the observed trends at discrete pressure levels (which would have made for a very messy Figure, given that we show results from 7 different observational datasets). Had we attempted to show the observed standard errors in Figure 6A, I suspect that standard errors from the RICH, IUK, RAOBCORE-v1.3, and RAOBCORE 1.4 datasets would have overlapped with the multi-model average trend at most pressure levels. I can easily produce such a Figure if necessary.

With best regards,

Ben

Dear folks, While on travel in Hawaii, I received a request from Steven McIntyre for all of the model data used in our IJoC paper (see forwarded email). After some conversation with my PCMDI colleagues, I have decided not to respond to McIntyre's request. If McIntyre repeats his request, I will provide him with the same answer that I gave to David Douglass - all model and observational data used in our IJoC paper are freely available to scientific researchers (as are algorithms for calculating synthetic MSU temperatures from climate model and radiosonde data). If Mr. McIntyre wishes to "audit" our analysis and findings, he has access to exactly the same raw data that we employed. He can compute synthetic MSU temperatures exactly the same way that we did. And he has full details of the statistical tests we applied to compare modeled and observed temperature trends. Recall that McIntyre is the guy who "audited" the temperature reconstructions of Mike Mann and colleagues. Now it appears as if McIntyre wants to audit us. McIntyre should have "audited" the methods and findings of Douglass et al. 2007 - not the methods and findings of Santer et al. 2008. I thought you should know about this development. With best regards, Ben

Dear Dr Santer,

Could you please provide me either with the monthly model data (49 series) used for statistical analysis in Santer et al 2008 or a link to a URL. I understand that your version has been collated from PCMDI ; my interest is in a file of the data as you used it (I presume that the monthly data used for statistics is about 1-2 MB)

Thank you for your attention,

Steve McIntyre

Dear Ben,

many thanks for the full response to my query. I think my confusion arose from the discussion on RealClimate (which prompted our earlier communication on this topic), which clearly suggested that the observed trend should be expected to lie within the spread of the models, rather than necessarily being close to the mean as the models are stochastic simulations (which seemed reasonable). I've just re-read that post, the key paragraph from [1]<http://www.realclimate.org/index.php/archives/2007/12/tropical-troposphere-trends/> is as follows:

"The interpretation of this is a little unclear (what exactly does the sigma refer to?), but the most likely interpretation, and the one borne out by looking at their Table IIa, is that sigma is calculated as the standard deviation of the model trends. In that case, the formula given defines the uncertainty on the estimate of the mean - i.e. how well we know what the average trend really is. But it only takes a moment to realise why that is irrelevant. Imagine there were 1000's of simulations drawn from the same distribution, then our estimate of the mean trend would get sharper and sharper as N increased. However, the chances that any one realisation would be within those error bars, would become smaller and smaller. Instead, the key standard deviation is simply sigma itself. That defines the likelihood that one realisation (i.e. the real world) is conceivably drawn from the distribution defined by the models."

I had therefore expected the test to use the standard deviations of both the models and the observations (which would give a flat plot in 5B and there would be an obvious overlap of the uncertainties in 6a at say 500hPa).

best regards

Gavin

Subject: Re: Possible error in recent IJC paper

Dear Gavin,

Thanks very much for your email, and for your interest in our recent paper in the International Journal of Climatology (IJoC). There is no error in equation (12) in our IJoC paper. Let me try to answer the questions that you posed.

The first term under the square root in our equation (12) is a standard estimate of the variance of a sample mean - see, e.g., "Statistical Analysis in Climate Research", by Francis Zwiers and Hans von Storch, Cambridge University Press, 1999 (their equation 5.24, page 86). The second term under the square root sign is a very different beast - an estimate of the variance of the observed trend. As we point out, our $d1^*$ test is very similar to a standard Student's t-test of differences in

means (which involves, in its denominator, the square root of two pooled sample variances).

In testing the statistical significance of differences between the model average trend and a single observed trend, Douglass et al. were wrong to use σ_{SE} as the sole measure of trend uncertainty in their statistical test. Their test assumes that the model trend is uncertain, but that the observed trend is perfectly-known. The observed trend is not a "mean" quantity; it is NOT perfectly-known. Douglass et al. made a demonstrably false assumption.

Bottom line: σ_{SE} is a standard estimate of the uncertainty in a sample mean - which is why we use it to characterize uncertainty in the estimate of the model average trend in equation (12). It is NOT appropriate to use σ_{SE} as the basis for a statistical test between two uncertain quantities. The uncertainty in the estimates of both modeled AND observed trend needs to be explicitly incorporated in the design of any statistical test seeking to compare modeled and observed trends. Douglass et al. incorrectly ignored uncertainties in observed trends.

I hope this answers your first question, and explains why there is no inconsistency between the formulation of our $d1^*$ test in equation (12) and the comments that we made in point #3 [immediately before equation (12)]. As we note in point #3, "While σ_{SE} is an appropriate measure of how well the multi-model mean trend can be estimated from a finite sample of model results, it is not an appropriate measure for deciding whether this trend is consistent with a single observed trend."

We could perhaps have made point #3 a little clearer by inserting "imperfectly-known" before "observed trend". I thought, however, that the uncertainty in the estimate of the observed trend was already made very clear in our point #1 (on page 7, bottom of column 2).

To answer your second question, $d1^*$ gives a reasonably flat line in Figure 5B because the first term under the square root sign in equation (12) (the variance of the model average trend, which has a dependence on N , the number of models used in the test) is roughly a factor of 20 smaller than the second term under the square root sign (the variance of the observed trend, which has no dependence on N). The behaviour of $d1^*$ with synthetic data is therefore dominated by the second term under the square root sign - which is why the black lines in Figure 5B are flat.

In answer to your third question, our Figure 6A provides only one of the components from the denominator of our $d1^*$ test (σ_{SE}). Figure 6A does not show the standard errors in the observed trends at discrete pressure levels. Had we attempted to show the observed standard errors at individual pressure levels, we would have produced a very messy Figure, since Figure 6A shows results from 7 different observational datasets.

We could of course have performed our $d1^*$ test at each discrete pressure level. This would have added another bulky Table to an already lengthy paper. We judged that it was sufficient to perform our $d1^*$ test with the synthetic MSU T2 and T2LT temperature trends calculated from the seven radiosonde datasets and the climate model data. The results of such

tests are reported in the final paragraph of Section 7. As we point out, the d_1^* test "indicates that the model-average signal trend (for T2LT) is not significantly different (at the 5% level) from the observed signal trends in three of the more recent radiosonde products (RICH, IUK, and RAOBCORE v1.4)." So there is no inconsistency between the formulation of our d_1^* test in equation (12) and the results displayed in Figure 6.

Thanks again for your interest in our paper, and my apologies for the delay in replying to your email - I have been on travel (and out of email contact) for the past 10 days.

With best regards,

Ben

Subject: Re: Possible error in recent IJC paper

Dear Gavin,

Thanks very much for your email, and for your interest in our recent paper in the International Journal of Climatology (IJoC). There is no error in equation (12) in our IJoC paper. Let me try to answer the questions that you posed.

The first term under the square root in our equation (12) is a standard estimate of the variance of a sample mean - see, e.g., "Statistical Analysis in Climate Research", by Francis Zwiers and Hans von Storch, Cambridge University Press, 1999 (their equation 5.24, page 86). The second term under the square root sign is a very different beast - an estimate of the variance of the observed trend. As we point out, our $d1^*$ test is very similar to a standard Student's t-test of differences in means (which involves, in its denominator, the square root of two pooled sample variances).

In testing the statistical significance of differences between the model average trend and a single observed trend, Douglass et al. were wrong to use σ_{SE} as the sole measure of trend uncertainty in their statistical test. Their test assumes that the model trend is uncertain, but that the observed trend is perfectly-known. The observed trend is not a "mean" quantity; it is NOT perfectly-known. Douglass et al. made a demonstrably false assumption.

Bottom line: σ_{SE} is a standard estimate of the uncertainty in a sample mean - which is why we use it to characterize uncertainty in the estimate of the model average trend in equation (12). It is NOT appropriate to use σ_{SE} as the basis for a statistical test between two uncertain quantities. The uncertainty in the estimates of both modeled AND observed trend needs to be explicitly incorporated in the design of any statistical test seeking to compare modeled and observed trends. Douglass et al. incorrectly ignored uncertainties in observed trends.

I hope this answers your first question, and explains why there is no inconsistency between the formulation of our $d1^*$ test in equation (12) and the comments that we made in point #3 [immediately before equation

(12)]. As we note in point #3, "While σ_{SE} is an appropriate measure of how well the multi-model mean trend can be estimated from a finite sample of model results, it is not an appropriate measure for deciding whether this trend is consistent with a single observed trend."

We could perhaps have made point #3 a little clearer by inserting "imperfectly-known" before "observed trend". I thought, however, that the uncertainty in the estimate of the observed trend was already made very clear in our point #1 (on page 7, bottom of column 2).

To answer your second question, $d1^*$ gives a reasonably flat line in Figure 5B because the first term under the square root sign in equation (12) (the variance of the model average trend, which has a dependence on N , the number of models used in the test) is roughly a factor of 20 smaller than the second term under the square root sign (the variance of the observed trend, which has no dependence on N). The behaviour of $d1^*$ with synthetic data is therefore dominated by the second term under the square root sign - which is why the black lines in Figure 5B are flat.

In answer to your third question, our Figure 6A provides only one of the components from the denominator of our $d1^*$ test (σ_{SE}). Figure 6A does not show the standard errors in the observed trends at discrete pressure levels. Had we attempted to show the observed standard errors at individual pressure levels, we would have produced a very messy Figure, since Figure 6A shows results from 7 different observational datasets.

We could of course have performed our $d1^*$ test at each discrete pressure level. This would have added another bulky Table to an already lengthy paper. We judged that it was sufficient to perform our $d1^*$ test with the synthetic MSU T2 and T2LT temperature trends calculated from the seven radiosonde datasets and the climate model data. The results of such tests are reported in the final paragraph of Section 7. As we point out, the $d1^*$ test "indicates that the model-average signal trend (for T2LT) is not significantly different (at the 5% level) from the observed signal trends in three of the more recent radiosonde products (RICH, IUK, and RAOBCORE v1.4)." So there is no inconsistency between the formulation of our $d1^*$ test in equation (12) and the results displayed in Figure 6.

Thanks again for your interest in our paper, and my apologies for the delay in replying to your email - I have been on travel (and out of email contact) for the past 10 days.

Dear Mr. McIntyre,

I gather that your intent is to "audit" the findings of our recently-published paper in the International Journal of Climatology (IJoC). You are of course free to do so. I note that both the gridded model and observational datasets used in our IJoC paper are freely available to researchers. You should have no problem in accessing exactly the same model and observational datasets that we employed. You will need to do a little work in order to calculate synthetic Microwave Sounding Unit (MSU) temperatures from climate model atmospheric temperature information. This should not pose any difficulties for you. Algorithms for calculating synthetic MSU temperatures have been published by ourselves and others in the peer-reviewed literature. You will also need to calculate spatially-averaged temperature changes from the gridded model and observational data. Again, that should not be too taxing.

In summary, you have access to all the raw information that you require in order to determine whether the conclusions reached in our IJoC paper are sound or unsound. I see no reason why I should do your work for you, and provide you with derived quantities (zonal means, synthetic MSU temperatures, etc.) which you can easily compute yourself.

I am copying this email to all co-authors of the 2008 Santer et al. IJoC paper, as well as to Professor Glenn McGregor at IJoC.

I gather that you have appointed yourself as an independent arbiter of the appropriate use of statistical tools in climate research. Rather than "auditing" our paper, you should be directing your attention to the 2007 IJoC paper published by David Douglass et al., which contains an egregious statistical error.

Please do not communicate with me in the future.

Ben Santer

Dear Tom,

Thanks for your email regarding Steven McIntyre's twin requests under the Freedom of Information (FOI) Act. Regarding McIntyre's request (1), no "monthly time series of output from any of the 47 climate models" was "sent by Santer and/or other coauthors of Santer et al 2008 to NOAA employees between 2006 and October 2008".

As I pointed out to Mr. McIntyre in the email I transmitted to him yesterday, all of the raw (gridded) model and observational data used in the 2008 Santer et al. International Journal of Climatology (IJoC) paper are freely available to Mr. McIntyre. If Mr. McIntyre wishes to audit us, and determine whether the conclusions reached in our paper are sound, he has all the information necessary to conduct such an audit. Providing Mr. McIntyre with the quantities that I derived from the raw model data (spatially-averaged time series of surface temperatures and synthetic Microwave Sounding Unit [MSU] temperatures) would defeat the very purpose of an audit.

I note that David Douglass and colleagues have already audited our calculation of synthetic MSU temperatures from climate model data. Douglass et al. obtained "model average" trends in synthetic MSU temperatures (published in their 2007 IJoC paper) that are virtually identical to our own.

McIntyre's request (2) demands "any correspondence concerning these monthly time series between Santer and/or other coauthors of Santer et al 2008 and NOAA employees between 2006 and October 2008". I do not know how you intend to respond this second request. You and three other NOAA co-authors on our paper (Susan Solomon, Melissa Free, and John Lanzante) probably received hundreds of emails that I sent to you in the course of our work on the IJoC paper. I note that this work began in December 2007, following online publication of Douglass et al. in the IJoC. I have no idea why McIntyre's request for email correspondence has a

"start date" of 2006, and thus predates publication of Douglass et al.

My personal opinion is that both FOI requests (1) and (2) are intrusive and unreasonable. Steven McIntyre provides absolutely no scientific justification or explanation for such requests. I believe that McIntyre is pursuing a calculated strategy to divert my attention and focus away from research. As the recent experiences of Mike Mann and Phil Jones have shown, this request is the thin edge of wedge. It will be followed by further requests for computer programs, additional material and explanations, etc., etc.

Quite frankly, Tom, having spent nearly 10 months of my life addressing the serious scientific flaws in the Douglass et al. IJoC paper, I am unwilling to waste more of my time fulfilling the intrusive and frivolous requests of Steven McIntyre. The supreme irony is that Mr. McIntyre has focused his attention on our IJoC paper rather than the Douglass et al. IJoC paper which we criticized. As you know, Douglass et al. relied on a seriously flawed statistical test, and reached incorrect conclusions on the basis of that flawed test.

I believe that our community should no longer tolerate the behavior of Mr. McIntyre and his cronies. McIntyre has no interest in improving our scientific understanding of the nature and causes of climate change. He has no interest in rational scientific discourse. He deals in the currency of threats and intimidation. We should be able to conduct our scientific research without constant fear of an "audit" by Steven McIntyre; without having to weigh every word we write in every email we send to our scientific colleagues.

In my opinion, Steven McIntyre is the self-appointed Joe McCarthy of climate science. I am unwilling to submit to this McCarthy-style investigation of my scientific research. As you know, I have refused to send McIntyre the "derived" model data he requests, since all of the primary model data necessary to replicate our results are freely available to him. I will continue to refuse such data requests in the future. Nor will I provide McIntyre with computer programs, email correspondence, etc. I feel very strongly about these issues. We should not be coerced by the scientific equivalent of a playground bully.

I will be consulting LLNL's Legal Affairs Office in order to determine how the DOE and LLNL should respond to any FOI requests that we receive from McIntyre. I assume that such requests will be forthcoming.

I am copying this email to all co-authors of our 2008 IJoC paper, to my immediate superior at PCMDI (Dave Bader), to Anjuli Bamzai at DOE headquarters, and to Professor Glenn McGregor (the editor who was in charge of our paper at IJoC).

I'd be very happy to discuss these issues with you tomorrow. I'm sorry that the tone of this letter is so formal, Tom. Unfortunately, after today's events, I must assume that any email I write to you may be subject to FOI requests, and could ultimately appear on McIntyre's "ClimateAudit" website.

With best personal wishes,

Ben

Hmmm. I note the following , , ,

"at which I can be contacted between 9 and 7 pm Eastern Daylight Time"

Is this a 22 hour, or, for people with time machine, a negative 2 hour
window?

Joking aside, it seems as a matter of principle (albeit a principle yet
to be set by the courts) that provision of primary data sources that are
sufficient to reproduce the results of a scientific analysis is all that
is necessary under FOI.

It also seems that judgment of what correspondence is central to the
analysis can only be made by the persons involved. As a participant in
many of these inter-author communications, I do not recall any that
would give information not already contained in the published paper.

Tom.

To: santer1@llnl.gov
Subject: Re: [Fwd: FOI Request]
Date: Wed Nov 12 09:31:31 2008

Ben,

Another point to discuss when you have your conference call - is why don't they ask Douglass for all his data. It is essentially the same.

You can also think of all this positively - they think a few of us do really important work, so they concentrate on what they think are the cutting edge pieces of work.

I have a big review on paleo coming out soon in *The Holocene* - with 20+ others. Won't be out till next year, but I can say for certain that it will feature strongly on CA. Not too much they can request via FOI, but they will think of something. This paper will explain where a Figure came from in the First IPCC Report - the infamous one that Chris Folland put together on the last 1000 years. CA will say they found this out - they had

a thread on it 9 months ago according to Gavin. I have the submission date of the article and more detail though - to show we found out first.

Cheers

Phil

At 03:57 12/11/2008, you wrote:

Dear Tom,

We should be able to conduct our scientific research without constant fear of an "audit" by Steven McIntyre; without having to weigh every word we write in every email we send to our scientific colleagues.

In my opinion, Steven McIntyre is the self-appointed Joe McCarthy of climate science. I am unwilling to submit to this McCarthy-style investigation of my scientific research. As you know, I have refused to send McIntyre the "derived" model data he requests, since all of the primary model data necessary to replicate our results are freely available to him. I will continue to refuse such data requests in the future. Nor will I provide McIntyre with computer programs, email correspondence, etc. I feel very strongly about these issues. We should not be coerced by the scientific equivalent of a playground bully.

I will be consulting LLNL's Legal Affairs Office in order to determine how the DOE and LLNL should respond to any FOI requests that we receive from McIntyre. I assume that such requests will be forthcoming.

I am copying this email to all co-authors of our 2008 IJoC paper, to my immediate superior at PCMDI (Dave Bader), to Anjuli Bamzai at DOE headquarters, and to Professor Glenn McGregor (the editor who was in charge of our paper at IJoC).

I'd be very happy to discuss these issues with you tomorrow. I'm sorry that the tone of

this letter is so formal, Tom. Unfortunately, after today's events, I must assume that any email I write to you may be subject to FOI requests, and could ultimately appear on McIntyre's "ClimateAudit" website.

With best personal wishes,

Ben

Subject: FOI Request

Date: Mon, 10 Nov 2008 10:02:00 -0500

From: Steve McIntyre <stephen.mcintyre@utoronto.ca>

To: FOIA@noaa.gov

CC: Thomas R Karl <Thomas.R.Karl@noaa.gov>

Nov. 10, 2008

National Oceanic and Atmospheric Administration

Public Reference Facility (OFA56)

Attn: NOAA FOIA Officer

1315 East West Highway (SSMC3)

Room 10730

Silver Spring, Maryland 20910

Re: Freedom of Information Act Request

Dear NOAA FOIA Officer:

This is a request under the Freedom of Information Act.

Santer et al, Consistency of modelled and observed temperature trends in the tropical troposphere, (Int J Climatology, 2008), of which NOAA employees J. R. Lanzante, S. Solomon, M. Free and T. R. Karl were co-authors, reported on a statistical analysis of the output of 47 runs of climate models that had been collated into monthly time series by Benjamin Santer and associates.

I request that a copy of the following NOAA records be provided to me: (1) any monthly time series of output from any of the 47 climate models sent by Santer and/or other coauthors of Santer et al 2008 to NOAA employees between 2006 and October 2008; (2) any correspondence concerning these monthly time series between Santer and/or other coauthors of Santer et al 2008 and NOAA employees between 2006 and October 2008.

The primary sources for NOAA records are J. R. Lanzante, S. Solomon, M. Free and T. R. Karl.

In order to help to determine my status for purposes of determining the applicability of any fees, you should know that I have 5 peer-reviewed publications on paleoclimate; that I was a reviewer for WG1; that I made a invited presentations in 2006 to the National Research Council Panel on Surface Temperature Reconstructions and two presentations to the Oversight and Investigations Subcommittee of the House Energy and Commerce Committee.

In addition, a previous FOI request was discussed by the NOAA Science Advisory Boards Data Archiving and Access Requirements Working Group (DAARWG). [1][http:// www.joss.ucar.edu/daarwg/may07/presentations/KarL_DAARWG_NOAAArchivepolify-v0514.pdf](http://www.joss.ucar.edu/daarwg/may07/presentations/KarL_DAARWG_NOAAArchivepolify-v0514.pdf).

I believe a fee waiver is appropriate since the purpose of the request is academic research, the information exists in digital format and the information should be easily located by the primary sources.

I also include a telephone number (416-469-3034) at which I can be contacted between 9 and 7 pm Eastern Daylight Time, if necessary, to discuss any aspect of my request.

Thank you for your consideration of this request.

I ask that the FOI request be processed promptly as NOAA failed to send me a response to the FOI request referred to above, for which Dr Karl apologized as follows:

due to a miscommunication between our office and our headquarters, the response was not submitted to you. I deeply apologize for this oversight, and we have taken measures to ensure this does not happen in the future.

Subject: Re: GHCN
Date: Mon Nov 17 17:04:27 2008

Gavin,

First the figures are just for you - don't pass on!!! I don't normally see these. I just asked my MOHC contact - and he's seen the furore on the blogs. Why did the Daily Telegraph run with the story - it's all back to their readers thinking the UK is run by another country!

These 3 paras (below) are from the GHCN web site. They appear to be the only mention I can see of the WMO CLIMAT network on a web site. The rigorous QC that is being talked about is

done in retrospect. They don't do much in real time - except an outlier check.

Anyway - the CLIMAT network is part of the GTS. The members (NMSs) send their monthly averages/total around the other NMSs on the 4th and the 18-20th of the month afterwards. Few seem to adhere to these dates much these days, but the aim is to send the data around twice in the following month. Data comes in code like everything else on the GTS, so a few centres (probably a handful, NOAA/CPC, MOHC, MeteoFrance, DWD, Roshydromet, CMA, JMA and the Australians) that are doing analyses for weather forecasts have the software to pick out the CLIMAT data and put it somewhere.

At the same time these same centres are taking the synop data off the system and summing it to months - producing flags of how much was missing. At the MOHC they compare the CLIMAT message with the monthly calculated average/total. If they are close they accept the CLIMAT. Some countries don't use the mean of max and min (which the synops provide) to calculate the mean, so it is important to use the CLIMAT as this is likely to ensure continuity. If they don't agree they check the flags and there needs to be a bit of human intervention. The figures are examples for this October.

What often happens is that countries send out the same data for the following month. This happens mostly in developing countries, as a few haven't yet got software to produce the CLIMAT data in the correct format. There is WMO software to produce these from a wide variety of possible formats the countries might be using. Some seem to do this by overwriting the files from the previous month. They add in the correct data, but then forget to save the revised file. Canada did this a few years ago - but they sent the correct data around a day later and again the second time, after they got told by someone at MOHC.

My guess here is that NOAA didn't screw up, but that Russia did. For all countries except Russia, all data for that country comes out together. For Russia it comes out in regions - well it is a big place! Trying to prove this would need some Russian help - Pasha Groisman? - but there isn't much point. The fact that all the affected

data were from one Russian region suggests to me it was that region.

Probably not of much use to an FAQ!

Cheers

Phil

The Global Historical Climatology Network (GHCN-Monthly) data base contains historical temperature, precipitation, and pressure data for thousands of land stations worldwide. The period of record varies from station to station, with several thousand extending back to 1950 and several hundred being updated monthly via CLIMAT reports. The data are available without charge through NCDCs anonymous FTP service.

Both historical and near-real-time GHCN data undergo rigorous quality assurance reviews. These reviews include preprocessing checks on source data, time series checks that identify spurious changes in the mean and variance, spatial comparisons that verify the accuracy of the climatological mean and the seasonal cycle, and neighbor checks that identify outliers from both a serial and a spatial perspective.

GHCN-Monthly is used operationally by NCDC to monitor long-term trends in temperature and precipitation. It has also been employed in several international climate assessments, including the Intergovernmental Panel on Climate Change 4th Assessment Report, the Arctic Climate Impact Assessment, and the "State of the Climate" report published annually by the Bulletin of the American Meteorological Society.

At 12:56 17/11/2008, you wrote:

thanks.

Actually, I don't think that many people have any idea how the NWS's send out data, what data they send out, what they don't and how these things are collated. Perhaps you'd like to send me some notes on this that I could write up as a FAQ? Won't change anything much, but it would be a handy reference....

Ben,

I support you on this. However, there is more to be said than what you give below. For instance, it would be useful to note that, in principle, an audit scheme could be a good thing if done properly. But an audit must start at square one (your point). So, one can appear to applaud McIntyre at first, but then go on to note that his modus operandi seems to be flawed.

In this case, as you have noted before, if Mc could not get the data from us, then he could have got it from Douglass. Given this, it is strange to keep hounding us. This would, of course, raise the issue of whether the Douglass data are the same as ours (and/or the same as in CCSP 1.1). I'm not sure whether Douglass et al. actually state that their data are the same as CCSP 1.1, but it would be good if they did -- because our IJoC data are the same as CCSP 1.1.

Mc could say that Douglass already effectively audited our calculations from the raw data, which is why he does not want to/need to repeat this step. But if he does say this then why not get the data from Douglass?

Have a go at writing something -- but try to pre-empt any come back from Mc or others. Also, don't just consider our case, but put it as an example of more general issues.

The issue of auditing is a tricky one. The auditors must, themselves, be able to demonstrate that they have no ulterior motives. One way to do this would be to audit papers on both sides of an issue. In other words, both us and Douglass should be audited together. In a sense, our paper is an audit of Douglass -- and we found his work to be flawed. A second opinion on this already exists, through the refereeing of our paper. I suppose a third opinion from the likes of Mc might be of value in a controversial area like this. But then, is Mc the right person to do this? Is he unbiased? Does he have the right credentials (as a statistician)?

One could argue that IPCC had an auditing system in place. This is

partly through the multiple levels of review -- but doesn't each chapter have another person(s) to sign off on the responses to review comments?

There are some interesting general issues here.

Tom.

Ben, there are two very different things going on here. One is technical and related to the actual science and the actual statistics, the second is political, and is much more concerned with how incidents like this can be portrayed. The second is the issue here.

The unfortunate fact is that the 'secret science' meme is an extremely powerful rallying call to people who have no idea about what is going on. Claiming (rightly or wrongly) that information is being hidden has a huge amount of resonance (as you know), much more so than whether Douglass et al know their statistical elbow from a hole in the ground.

Thus any increase in publicity on this - whether in the pages of Nature or elsewhere - is much more likely to bring further negative fallout despite your desire to clear the air. Whatever you say, it will still be presented as you hiding data.

The contrarians have found that there is actually no limit to what you can ask people for (raw data, intermediate steps, additional calculations, residuals, sensitivity calculations, all the code, a workable version of the code on any platform etc.), and like Somali pirates they have found that once someone has paid up, they can always shake them down again.

Thus, I would not advise any public statements on this. Instead, email you immediate superiors and the director with a short statement along the lines of what you suggest below (i.e. of course you want open science, the data *are* in the public domain (with links) and calls for more intermediate steps are just harassment to prevent scientists doing what they are actually paid too). I wouldn't put in anything specifically related to McIntyre.

A much more satisfying response would be to demonstrate how easy it is to replicate the analysis in the paper starting from scratch using openly available data (such as through Joe Sirott's portal) and the simplest published MSU weighting function. If you can show that this can be done in a couple of hours (or whatever), it makes the other side look like incompetent amateurs. Maybe someone has a graduate student available....?

Gavin

Ben,

When the FOI requests began here, the FOI person said we had to abide by the requests. It took a couple of half hour sessions - one at a screen, to convince them otherwise showing them what CA was all about. Once they became aware of the types of people we were dealing with, everyone at UEA (in the registry and in the Environmental Sciences school - the head of school and a few others) became very supportive. I've got to know the FOI person quite well and the Chief Librarian - who deals with appeals. The VC is also aware of what is going on - at least for one of the requests, but probably doesn't know the number we're dealing with. We are in double figures.

One issue is that these requests aren't that widely known within the School. So I don't know who else at UEA may be getting them. CRU is moving up the ladder of requests at UEA though - we're way behind computing though. We're away of requests going to others in the UK - MOHC, Reading, DEFRA and Imperial College.

So spelling out all the detail to the LLNL management should be the first thing you do. I hope that Dave is being supportive at PCMDI.

The inadvertent email I sent last month has led to a Data Protection Act request sent by a certain Canadian, saying that the email maligned his scientific credibility with his peers!

If he pays 10 pounds (which he hasn't yet) I am supposed to go through my emails and he can get anything I've written about him. About 2 months ago I deleted loads of emails, so have very little - if anything at all. This legislation is different from the FOI -

it is supposed to be used to find out why you might have a poor credit rating !

In response to FOI and EIR requests, we've put up some data - mainly paleo data. Each request generally leads to more - to explain what we've put up. Every time, so far, that hasn't led to anything being added - instead just statements saying read what is in the papers and what is on the web site! Tim Osborn sent one such response (via the FOI person) earlier this week. We've never sent programs, any codes and manuals.

In the UK, the Research Assessment Exercise results will be out in 2 weeks time. These are expensive to produce and take too much time, so from next year we'll be moving onto a metric based system. The metrics will be # and amounts of grants, papers and citations etc. I did flippantly suggest that the # of FOI requests you get should be another.

When you look at CA, they only look papers from a handful of people. They will start on another coming out in The Holocene early next year. Gavin and Mike are on this with loads of others. I've told both exactly what will appear on CA once they get access to it!

Cheers

Phil

At 01:17 03/12/2008, Ben Santer wrote:

Dear Tom,

I think that the idea of a Commentary in Science or Nature is a good one. Steve Sherwood made a similar suggestion. I'd be perfectly happy NOT to be involved in such a Commentary. My involvement would look too self-serving.

One of the problems is that I'm caught in a real Catch-22 situation. At present, I'm damned and publicly vilified because I refused to provide McIntyre with the data he requested. But had I acceded to McIntyre's initial request for climate model data, I'm convinced (based on the past experiences of Mike Mann, Phil, and Gavin) that I would

have spent years of my scientific career dealing with demands for further explanations, additional data, Fortran code, etc. (Phil has been complying with FOIA requests from McIntyre and his cronies for over two years). And if I ever denied a single request for further information, McIntyre would have rubbed his hands gleefully and written: "You see - he's guilty as charged!" on his website.

You and I have spent over a decade of our scientific careers on the MSU issue, Tom. During much of that time, we've had to do science in "reactive mode", responding to the latest outrageous claims and inept science by John Christy, David Douglass, or S. Fred Singer. For the remainder of my scientific career, I'd like to dictate my own research agenda. I don't want that agenda driven by the constant need to respond to Christy, Douglass, and Singer. And I certainly don't want to spend years of my life interacting with the likes of Steven McIntyre.

I hope LLNL management will provide me with their full support. If they do not, I'm fully prepared to seek employment elsewhere.

With best regards,

Ben

Tom Wigley wrote:

Ben,

Re the idea Michael sent around (to Revkin et al.) this is something that Nature or Science might like as a Commentary. It might even be possible to include some indirect reference to the Mc audit issue. The notes I sent could be a starting point. One problem is that you could not be first author as this would look like garnering publicity for your own work (as the 2 key papers are both Santer et al.) Even having me as the first author may not work. An ideal person would be Tom Karl, who sent me a response saying "nice summary".

What do you think?

Tom.

Tom,

Obviously don't pass on! These proofs have gone back with about 60 changes to be made. Should be out first issue of 2009.

The bet is that CA will say they found that the IPCC Figure from 1990 was a Lamb diagram 6 months ago. They did, but they didn't get the right source, and our paper was submitted in early 2008. CA will also comment on the section on pp21-31. The summary of where we are with the individual proxies is useful for most of them - but we didn't get anyone working with speleothems involved. I remain unconvinced they get the resolution claimed. Yet to see a speleothem paper which doesn't compare their (individual site) reconstruction with either the MBH series or a solar proxy.

I hope Ben gets the support from PCMDI and LLNL.

Cheers

Subject: the paper and a can of worms
Date: Tue, 9 Dec 2008 11:49:09 -0700

hi all, I plan on sending the 'penultimate' draft of the full paper later today, but thought I'd comment on the NH/SH comparison in a separate email. Anyway, I've been debating adding a comparison of the NH and SH, as per your suggestions. But I think I'm going to delay that discussion to a different paper. The current paper is already long. And I think looking at the differences between the hemispheres is going to open a can of worms. Here is an example that influenced my thinking: The time series in the attached figure show the differences between the NH and SH mean (0-90N minus 0-90S) for the raw data (top) and ENSO/COWL residual data (bottom). (COWL is removed only from the NH). Among many things, the difference time series show that the cooling in the 70s is largest in the NH, which we know from previous work. Maybe it's just my eye, but the differences between the time series in the 70s look almost discrete. It's as if the NH ratcheted downwards relative to the SH in a very short period ~1968, then crept upwards through the present. My thinking is that we will get a lot of mileage out of comparing the hemispheres, but that to do it right, it's going to take a fair bit more analysis. And at 27 pages I think we're pushing the attention span of the average reader. So I'm going to delay the analysis to our next paper. It gives us something to do in future! Paper will follow later... -Dave

Subject: Re: A quick question
Date: Wed Dec 10 10:14:10 2008

Ben,

Haven't got a reply from the FOI person here at UEA. So I'm not entirely confident the numbers are correct. One way of checking would be to look on CA, but I'm not doing that. I did get an email from the FOI person here early yesterday to tell me I shouldn't be deleting emails - unless

this was 'normal' deleting to keep emails manageable! McIntyre hasn't paid his £10, so nothing looks likely to happen re his Data Protection Act email.

Anyway requests have been of three types - observational data, paleo data and who made IPCC changes and why. Keith has got all the latter - and there have been at least 4. We made Susan aware of these - all came from David Holland. According to the FOI Commissioner's Office, IPCC is an international organization, so is above any national FOI. Even if UEA holds anything about IPCC, we are not obliged to pass it on, unless it has anything to do with our core business - and it doesn't! I'm sounding like Sir Humphrey here!

McIntyre often gets others to do the requesting, but requests and responses all get posted up on CA regardless of who sends them.

On observational data, there have been at least 5 including a couple from McIntyre. Others here came from Eschenbach and also Douglas Keenan. The latter relate to Wei-Chyung Wang, and despite his being exonerated by SUNY, Keenan has not changed his web site since being told the result by SUNY!
[1]<http://www.informath.org/>

The paleo data requests have all been to Keith, and here Tim and Keith reply. The recent couple have come from McIntyre but there have been at least two others from Holland.

So since Feb 2007, CRU is in double figures. We never get any thanks for putting things up - only abuse and threats. The latest lot is up in the last 3-4 threads on CA.

I got this email over the weekend - see end of this email. This relates to what Tim sent back late last week. There was another one as well - a chatty one saying why didn't I respond to keep these people on CA quiet. I've ignored both.

Finally, I know that DEFRA receive Parliamentary Questions from MPs to answer. One of these 2 months ago was from a Tory MP asking how much money DEFRA has given to CRU over the last 5 years. DEFRA replied that they don't give money - they award grants based on open competition. DEFRA's system also told them there were no awards to CRU, as when we do get something it is

down as UEA!

I've occasionally checked DEFRA responses to FOI requests - all from Holland.

Cheers

Phil

Dear Mr Jones

What are you frightened of?

Is it that suddenly mugs like me who pay our taxes suddenly realise we are paying your wages.

Please respond to Climate Audit's valid queries otherwise I will contact my MP. Please see below.

Quote From CA

As it happens, I have experience in mining exploration programs and I can assure Phil Jones that, contrary to this experience enabling me to "understand why some samples are excluded", it gives me exactly the opposite perspective. It makes it virtually impossible for me to think up valid explanations for "excluding" some samples. It's illegal in the businesses that I know.

Anyhow, CRU answered as follows:

We have checked our files and no manuals, computer code, documents or correspondence are available. We can confirm, however, that we did not use a different Omoloyla data set and therefore there is no further data to provide.

Your behaviour is absolutely outrageous.

Best regards

Stuart Harmon

Dear Ben,

This is a good idea. However, will you give only tropical (20N-20S) results? I urge you to give data for other zones as well, viz, SH, NH, GL, 0-20N, 20-60N, 60-90N, 0-20S, 20-60S, 60-90S (plus 20N-20S). To have these numbers on line would be of great benefit to the community. In other words, although prompted by McIntyre's request, you will actually be giving something to everyone.

Also, if you can give N3.4 SSTs and SOI data, this would be an additional huge boon to the community.

For the data, what period will you cover. Although for our paper we only use data from 1979 onwards, to give data for the full 20th century runs would be of great benefit to all. This, of course, raises the issue of drift. Even over 1979 to 1999 some models show appreciable drift. From memory we did not account for this in our paper -- but it is an important issue.

This is a lot of work -- but the benefits to the community would be truly immense.

Finally, I think you need to formally get McIntyre to list the 47 models that he wants the data for. The current request is ambiguous -- or, at least, ill defined. I think it is crucial for McIntyre to state specifically what he wants. Even if we think we know what he wants, this is not good

enough -- FOIA requests must be clear, complete and unambiguous. This, after all, is a legal issue, and no court of law would accept anything less.

Tom.

Dear Lisa,

That's great news! I've confirmed with DOE that I can use up to \$10,000 of my DOE Fellowship to provide financial support for Tom's Symposium. I will check with Anjuli Bamzai at DOE to determine whether there are any strings attached to this money. I'm hopeful that we'll be able to use the DOE money for the Symposium dinner, and to defray some of the travel expenses of international participants who can't come up with their own travel money. I'll try to resolve this question in the next few days.

Best wishes to you and your family for a very Merry Christmas, and a happy, healthy, and peaceful 2009!

Ben

Dear Chris, cc: Doug

Mike McCracken makes a fair point. I am no expert on the observational uncertainties in tropospheric SO2 emissions over the recent past, but it is certainly the case that the SRES A1B scenario (for instance) as seen by different integrated assessment models shows a range of possibilities. In fact this has been an issue for us in the ENSEMBLES project, since we have been running models with a new mitigation/stabilization scenario "E1" (that has large emissions reductions relative to an A1B baseline, generated using the IMAGE IAM) and comparing it with A1B (the AR4 marker version, generated by a different IAM). The latter has a possibly unrealistic secondary SO2 emissions peak in the early 21st C - not present in the IMAGE E1 scenario, which has a steady decline in SO2 emissions from 2000. The A1B scenario as generated with IMAGE also show a decline rather than the secondary emissions peak, but I can't say for sure which is most likely to be "realistic".

The impact of the two alternative SO2 emissions trajectories is quite marked though in terms of global temperature response in the first few decades of the 21st C (at least in our HadGEM2-AO simulations, reflecting actual aerosol forcings in that model plus some divergence in GHG forcing). Ironically, the E1-IMAGE scenario runs, although much cooler in the long term of course, are considerably warmer than A1B-AR4 for several decades! Also - relevant to your statement - A1B-AR4 runs show potential for a distinct lack of warming in the early 21st C, which I'm sure skeptics would love to see replicated in the real world... (See the attached plot for illustration but please don't circulate this any further as these are results in progress, not yet shared with other ENSEMBLES partners let alone published). We think the different short term warming responses are largely attributable to the different SO2 emissions trajectories.

So far we've run two realisations of both the E1-IMAGE and A1B-AR4 scenarios with HadGEM2-AO, and other partners in ENSEMBLES are doing similar runs using other GCMs. Results will start to be analysed in a multi-model way in the next few months. CMIP5 (AR5) prescribes similar kinds of experiments, but the implementation details might well be different from ENSEMBLES experiments wrt scenarios and their SO2 emissions trajectories (I haven't studied the CMIP5 experiment fine print to that extent).

Cheers,
Tim

> We are now using the average of 4 AR4 scenarios you gave us for GHG + aerosol. What is the situation likely to be for AR5 forcing, particularly anthropogenic aerosols. Are there any new estimates yet? Particularly, will there be a revision in time for the 2010 forecast? We do in the meantime have an explanation for the interannual variability of the last decade. However this fits well only when an underlying net GHG+aerosol warming of 0.15C per decade is fitted in the statistical models. In a sense the methods we use would automatically fit to a reduced net warming rate so Mike McCracken can be told that. In other words the method creates it own transient climate sensitivity for recent warming. But the forcing rate underlying the method nevertheless perhaps sits a bit uncomfortably with the absolute forcing figures we are using from AR4. However having said this, interestingly, the statistics and DePreSys are in remarkable harmony about the temperature of 2009.

> Your prediction for 2009 is very interesting (see note below for notice that went around to email list for a lot of US Congressional staff)--and I would expect the analysis you have done is correct. But, I have one nagging question, and that is how much SO2/sulfate is being generated by the rising emissions from China and India (I know that at least some

plants are using desulfurization--but that antidotes are not an inventory). I worry that what the western nations did in the mid 20th century is going to be what the eastern nations do in the next few decades--go to tall stacks so that, for the near-term, "dilution is the solution to pollution". While I understand there are efforts to get much better inventories of CO2 emissions from these nations, when I asked a US EPA representative if their efforts were going to also inventory SO2 emissions (amount and height of emission), I was told they were not. So, it seems, the scientific uncertainty generated by not having good data from the mid-20th century is going to be repeated in the early 21st century (satellites may help on optical depth, but it would really help to know what is being emitted).

>

> That there is a large potential for a cooling influence is sort of evident in the IPCC figure about the present sulfate distribution--most is right over China, for example, suggesting that the emissions are near the surface--something also that is, so to speak, 'clear' from the very poor visibility and air quality in China and India. So, the quick, fast, cheap fix is to put the SO2 out through tall stacks. The cooling potential also seems quite large as the plume would go out over the ocean with its low albedo--and right where a lot of water vapor is evaporated, so maybe one pulls down the water vapor feedback a little and this amplifies the sulfate cooling influence.

>

> Now, I am not at all sure that having more tropospheric sulfate would be a bad idea as it would limit warming--I even have started suggesting that the least expensive and quickest geoengineering approach to limit global warming would be to enhance the sulfate loading--or at the very least we need to maintain the current sulfate cooling offset while we reduce CO2 emissions (and presumably therefore, SO2 emissions, unless we manage things) or we will get an extra bump of warming. Sure, a bit more acid deposition, but it is not harmful over the ocean (so we only/mainly emit for trajectories heading out over the ocean) and the impacts of deposition may well be less that for global warming (will be a tough comparison, but likely worth looking at). Indeed, rather than go to stratospheric sulfate injections, I am leaning toward tropospheric, but only during periods when trajectories are heading over ocean and material won't get rained out for 10 days or so.

> Would be an interesting issue to do research on--see what could be done.

>

> In any case, if the sulfate hypothesis is right, then your prediction of warming might end up being wrong. I think we have been too readily explaining the slow changes over past decade as a result of variability--that explanation is wearing thin. I would just suggest, as a backup to your prediction, that you also do some checking on the sulfate issue, just so you might have a quantified explanation in case the prediction is wrong. Otherwise, the Skeptics will be all over us--the world is really cooling, the models are no good, etc. And all this just as the US is about ready to get serious on the issue.

> On December 30, climate scientists from the UK Met Office and the University of East Anglia projected 2009 will be one of the top five warmest years on record. Average global temperatures for 2009 are predicted to be 0.4°C above the 1961-1990 average of 14 °C. A multiyear forecast using a Met Office climate model indicates a rapid return of global temperature to the long-term warming trend, with an increasing probability of record temperatures after 2009. The fact that 2009, like 2008, will not break records does not mean that global warming has gone away What matters is the underlying rate of warming, said Dr. Phil Jones, the director of climate research at the University of East Anglia. The presence of La Nina during the last year partially masked this underlying rate. Phenomena such as El Nino and La Nina have a significant influence on global surface temperature, said Dr. Chris Folland of the Met Office Hadley Center.
> Further warming to record levels is likely once a moderate El Nino develops. The transition from a La Nina effect to an El Nino one is expected late next year.

Tim, Chris,

I hope you're not right about the lack of warming lasting till about 2020. I'd rather hoped to see the earlier Met Office press release with Doug's paper that said something like - half the years to 2014 would exceed the warmest year currently on record, 1998!

Still a way to go before 2014.

I seem to be getting an email a week from skeptics saying where's the warming gone. I know the warming is on the decadal scale, but it would be nice to wear their smug grins away.

Chris - I presume the Met Office continually monitor the weather forecasts. Maybe because I'm in my 50s, but the language used in the forecasts seems a bit over the top re the cold. Where I've been for the last 20 days (in Norfolk) it doesn't seem to have been as cold as the forecasts.

I've just submitted a paper on the UHI for London - it is 1.6 deg C for the LWC. It comes out to 2.6 deg C for night-time minimums. The BBC forecasts has the countryside 5-6 deg C cooler than city centres on recent nights. The paper shows the UHI hasn't got any worse since 1901 (based on St James Park and Rothamsted).

Cheers

Phil

Phil

Maybe in your conclusions you should comment on the fact that some more general studies show relationships between the population or size of cities and the urban effect. This seems not to be true here. Is there any evidence from other studies of a "saturation effect" on urban warming in some cases? And why this might be so?

Chris,

Will look at later. Here is the UHI paper I submitted today to Weather.

Didn't take long to do. I started doing it as people kept on saying the UHI

in London (and this is only Central London) was getting worse. I couldn't

see it and Rothamsted and Wisley confirmed what I'd thought.

Any comments appreciated. Remember it is just Weather, and I tried to make it quite simple ! David did see it last month.

Cheers

Phil

"Thanks" Ben for this, hi all and happy new year. I had a similar experience--but not FOIA since we at Climatic Change are a private institution--with Stephen McIntyre demanding that I have the Mann et al cohort publish all their computer codes for papers published in Climatic Change. I put the question to the editorial board who debated it for weeks. The vast majority opinion was that scientists should give enough information on their data sources and methods so others who are scientifically capable can do their own brand of replication work, but that this does not extend to personal computer codes with all their undocumented sub routines etc. It would be odious requirement to have scientists document every line of code so outsiders could then just apply them instantly. Not only is this an intellectual property issue, but it would dramatically reduce our productivity since we are not in the business of producing software products for general consumption and have no resources to do so. The NSF, which funded the studies I published, concurred--so that ended that issue with Climatic Change at the time a few years ago.

This continuing pattern of harassment, as Ben rightly puts it in my opinion, in the name of due diligence is in my view an attempt to create a fishing expedition to find minor glitches or unexplained bits of code--which exist in nearly all our kinds of complex work--and then assert that the entire result is thus suspect. Our best way to deal with this issue of replication is to have multiple independent author teams, with their own codes and data sets, publishing independent work on the same topics--like has been done on the "hockey stick". That is how credible scientific replication should proceed.

Let the lawyers figure this out, but be sure that, like Ben is doing now, you disclose the maximum reasonable amount of information so competent scientists can do replication work, but short of publishing undocumented personalized codes etc. The end of the email Ben attached shows their intent--to discredit papers so they have no "evidentiary value in public policy"--what you resort to when you can't win the intellectual battle scientifically at IPCC or NAS.

Good luck with this, and expect more of it as we get closer to international climate policy actions, We are witnessing the "contrarian battle of the bulge" now, and expect that all weapons will be used.

Cheers, Steve

Subject: [Fwd: data request]

Dear coauthors of the Santer et al. International Journal of Climatology paper (and other interested parties),

I am forwarding an email I received this morning from a Mr. Geoff Smith.

The email concerns the climate model data used in our recently-published International Journal of Climatology (IJoC) paper. Mr. Smith has requested that I provide him with these climate model datasets. This request has been made to Dr. Anna Palmisano at DOE Headquarters and to Dr. George Miller, the Director of Lawrence Livermore National Laboratory.

I have spent the last two months of my scientific career dealing with multiple requests for these model datasets under the U.S. Freedom of Information Act (FOIA). I have been able to do little or no productive

research during this time. This is of deep concern to me.

From the beginning, my position on this matter has been clear and consistent. The primary climate model data used in our IJoC paper are part of the so-called "CMIP-3" (Coupled Model Intercomparison Project) archive at LLNL, and are freely available to any scientific researcher. The primary observational (satellite and radiosonde) datasets used in our IJoC paper are also freely available. The algorithms used for calculating "synthetic" Microwave Sounding Unit (MSU) temperatures from climate model data (to facilitate comparison with actual satellite temperatures) have been documented in several peer-reviewed publications. The bottom line is that any interested scientist has all the scientific information necessary to replicate the calculations performed in our IJoC paper, and to check whether the conclusions reached in that paper were sound.

Neither Mr. Smith nor Mr. Stephen McIntyre (Mr. McIntyre is the initiator of the FOIA requests to the U.S. DOE and NOAA, and the operator of the "ClimateAudit.com" blog) is interested in full replication of our calculations, starting from the primary climate model and observational data. Instead, they are demanding the value-added quantities we have derived from the primary datasets (i.e., the synthetic MSU temperatures).

I would like a clear ruling from DOE lawyers - ideally from both the NNSA and DOE Office of Science branches - on the legality of such data requests. They are troubling, for a number of reasons.

1. In my considered opinion, a very dangerous precedent is set if any derived quantity that we have calculated from primary data is subject to FOIA requests. At LLNL's Program for Climate Model Diagnosis and Intercomparison (PCMDI), we have devoted years of effort to the calculation of derived quantities from climate model output. These derived quantities include synthetic MSU temperatures, ocean heat content changes, and so-called "cloud simulator" products suitable for comparison with actual satellite-based estimates of cloud type, altitude, and frequency. The intellectual investment in such calculations is substantial.

2. Mr. Smith asserts that "there is no valid intellectual property justification for withholding this data". I believe this argument is incorrect. The synthetic MSU temperatures used in our IJoC paper - and the other examples of derived datasets mentioned above - are integral components of both PCMDI's ongoing research, and of proposals we have submitted to funding agencies (DOE, NOAA, and NASA). Can any competitor simply request such datasets via the U.S. FOIA, before we have completed full scientific analysis of these datasets?

3. There is a real danger that such FOIA requests could (and are already) being used as a tool for harassing scientists rather than for valid scientific discovery. Mr. McIntyre's FOIA requests to DOE and NOAA are but the latest in a series of such requests. In the past, Mr. McIntyre has targeted scientists at Penn State University, the U.K. Climatic Research Unit, and the National Climatic Data Center in

Asheville. Now he is focusing his attention on me. The common denominator is that Mr. McIntyre's attention is directed towards studies claiming to show evidence of large-scale surface warming, and/or a prominent human "fingerprint" in that warming. These serial FOIA requests interfere with our ability to do our job.

Mr. Smith's email mentions the Royal Meteorological Society's data archiving policies (the Royal Meteorological Society are the publishers of the International Journal of Climatology). Recently, Prof. Glenn McGregor (the Chief Editor of the IJoC) provided Mr. McIntyre with the following clarification:

"In response to your question about data policy my position as Chief Editor is that the above paper has been subject to strict peer review, supporting information has been provided by the authors in good faith which is accessible online (attached FYI) and the original data from which temperature trends were calculated are freely available. It is not the policy of the International Journal of Climatology to require that data sets used in analyses be made available as a condition of publication."

As many of you may know, I have decided to publicly release the synthetic MSU temperatures that were the subject of Mr. McIntyre's FOIA request (together with additional synthetic MSU temperatures which were not requested by Mr. McIntyre). These datasets have been through internal review and release procedures, and will be published shortly on PCMDI's website, together with a technical document which describes how synthetic MSU temperatures were calculated. I agreed to this publication process primarily because I want to spend the next few years of my career doing research. I have no desire to be "taken out" as scientist, and to be involved in years of litigation.

The public release of the MSU data used in our IJoC paper may or may not resolve these problems. If Mr. McIntyre's past performance is a guide to the future, further FOIA requests will follow. I would like to know that I have the full support of LLNL management and the U.S. Dept. of Energy in dealing with these unwarranted and intrusive requests.

I do not intend to reply to Mr. Smith's email.

Sincerely,

Ben Santer

Phil

Thanks. Bad news today. Nature Geosciences wont publish this because the Real Climate Blog mentions (more vaguely) the basic content of what we have written. That is indeed the reason Nature Geosciences have given. It seems blogs can now prevent publication! I have suggested to Jeff we try GRL but only after raising this issue with them.

Subject: RE: FW: Temperatures in 2009

Chris,

City population size and urban effects are not related that well. I think

a lot depends on where the city is in relation to the sea, large rivers and water bodies as well.

I did try and get population figures for London from various times during the 20th century.

I found these, but the area of London they referred to kept changing. Getting the

areas proved more difficult, as I though population density would be better. Those I

could find showed that the area was increasing, so I sort of gave up on it.

Whether London is saturated is not clear. The fact that LWC has a bigger UHI than SJP implies that if you did more development around SJP it could be raised. I doubt though that there will be any development in the Mall and on Horseguards Parade!

The Nature Geosciences paper looks good - so hope it gets reviewed favourably.

It will be a useful thing to refer to, but I can't see it cutting any ice with the skeptics.

They think the models are wrong, and can't get to grips with natural variability!

Thanks for the CV. I see I'm on an abstract for the Hawaii meeting! Only noticed as it was the last one on your list.

Cheers
Phil

>Maybe in your conclusions you should comment on the fact that some more general studies show relationships between the population or size of cities and the urban effect. This seems not to be true here. Is there any evidence from other studies of a "saturation effect" on urban warming in some cases? And why this might be so?

Chris,

Apart from contacting Gavin and Mike Mann (just informing them) you should appeal.

In essence it means that Real Climate is a publication.

If you do go to GRL I wouldn't raise the issue with them. Happy to be a suggested reviewer if you do go to GRL.

Cheers

Phil

Chris,

Worth pursuing - even if only GRL.

Possibly worth sending a note to Gavin Schmidt at Real Climate to say what Nature have used as a refusal!

Cheers

Phil

Phil

Thanks. Bad news today. Nature Geosciences wont publish this because the Real Climate Blog mentions (more vaguely) the basic content of what we have written. That is indeed the reason Nature Geosciences have given. It seems blogs can now prevent publication! I have suggested to Jeff we try GRL but only after raising this issue with them.

Chris

Subject: RE: FW: Temperatures in 2009

Chris,

City population size and urban effects are not related that well. I think a lot depends on where the city is in relation to the sea, large rivers and water bodies as well.

I did try and get population figures for London from various times during the 20th century.

I found these, but the area of London they referred to kept changing. Getting the areas proved more difficult, as I thought population density would be better. Those I could find showed that the area was increasing, so I sort of gave up on it.

Whether London is saturated is not clear. The fact that LWC has a bigger UHI than SJP implies that if you did more development around SJP it could be raised. I doubt though that there will be any development in the Mall and on Horseguards Parade!

The Nature Geosciences paper looks good - so hope it gets reviewed favourably. It will be a useful thing to refer to, but I can't see it cutting any ice with the skeptics.

They think the models are wrong, and can't get to grips with natural variability!

Thanks for the CV. I see I'm on an abstract for the Hawaii meeting! Only noticed as it was the last one on your list.

Cheers

Phil

Dear coauthors of the Santer et al. International Journal of Climatology paper (and other interested parties),

I have now publicly released the synthetic MSU tropical lower tropospheric temperatures that were the subject of Mr. Stephen McIntyre's request to the U.S. Dept. of Energy/National Nuclear Security Agency under the U.S. Freedom of Information Act (FOIA). I have also released additional synthetic MSU temperatures which were not requested by Mr. McIntyre. These synthetic MSU datasets are available on PCMDI's publicly-accessible website. The link to the datasets is:

<http://www-pcmdi.llnl.gov/projects/msu/index.php>

Technical information about the synthetic MSU datasets is provided in a document entitled:

"Information regarding synthetic Microwave Sounding Unit (MSU) temperatures calculated from CMIP-3 archive"

The link to the technical document is:

http://www-pcmdi.llnl.gov/projects/msu/MSU_doc.pdf

I hope that these datasets will prove useful for bona fide scientific research, and will be employed for such purposes only.

I am also hopeful that after publication of these datasets, I will be able to return to full-time research, unencumbered by further FOIA requests from Mr. McIntyre. In my opinion, Mr. McIntyre's FOIA requests are for the purpose of harassing Government scientists, and not for the purpose of improving our understanding of the nature and causes of climate change.

I'd like to thank Dave Bader, Bill Goldstein, and Pat Berge for helping me complete the process of reviewing, releasing, and publishing the synthetic MSU datasets and the technical document. And thanks to all of you for your support and encouragement over the past two months. It is deeply appreciated.

With best regards,

Ben

Dear Phil,

Yeah, I had already seen the stuff from McIntyre. Tom Peterson sent it to me. McIntyre has absolutely no understanding of climate science. He doesn't realize that, as the length of record increases and trend confidence intervals decrease, even trivially small differences between an individual observed trend and the multi-model average trend are judged to be highly significant. These model-versus-observed trend differences are, however, of no practical significance whatsoever - they are well within the structural uncertainties of the observed MSU trends.

It would be great if Francis and Myles got McIntyre's paper for review. Also, I see that McIntyre has put email correspondence with me in the Supporting Information of his paper. What a jerk!

I will write to Keith again. The Symposium wouldn't be the same without him. I think Tom would be quite disappointed.

Have fun in Switzerland!

With best regards,

Ben

Dear Mr. Smith,

Please do not lecture me on "good science and replicability". Mr. McIntyre had access to all of the primary model and observational data necessary to replicate our results. Full replication of our results would have required Mr. McIntyre to invest time and effort. He was unwilling to do that.

Our results were published in a peer-reviewed publication (the International Journal of Climatology). These results were fully available for "independent testing and replication by others". Indeed, I note that David Douglass et al. performed such independent testing and replication in their 2007 International Journal of Climatology paper.

Douglass et al. used the same primary climate model data that we employed. They did what Mr. McIntyre was unwilling to do - they independently calculated estimates of "synthetic" Microwave Sounding Unit (MSU) temperatures from climate model data. The Douglass et al. "synthetic" MSU temperatures are very similar to our own. The scientific differences between the Douglass et al. and Santer et al. results are primarily related to the different statistical tests that the two groups employed in their comparisons of models and observations. Demonstrably, the Douglass et al. statistical test contains several serious flaws, which led them to reach incorrect inferences regarding the level of agreement between modeled and observed temperature trends.

Mr. McIntyre could easily have examined the appropriateness of the Douglass et al. statistical test and our statistical test with randomly-generated data (as we did in our paper). Mr. McIntyre chose not to do that. He preferred to portray himself as a victim of evil Government-funded scientists. A good conspiracy theory always sells well.

Mr. Smith, you chose to take the extreme step of writing to LLNL and DOE management to complain about my "unresponsiveness" and my failure to provide data to Mr. McIntyre. You made your complaint on the basis of

the information available on Mr. McIntyre's blog. You did not understand - and still do not understand - that the primary model data used in our paper have always been freely available to any scientific researcher, and are currently being used by many hundreds of scientists around the world. Any competent climate scientist could perform full replication of our calculation of "synthetic" MSU temperatures - as Douglass et al. have already done.

Your email to George Miller and Anna Palmisano was highly critical of my behavior in this matter. Your criticism was entirely unjustified, and damaging to my professional reputation. I therefore see no point in establishing a dialogue with you. Please do not communicate with me in the future. I do not give you permission to distribute this email or post it on Mr. McIntyre's blog.

Sincerely,

Dr. Ben Santer

Dear Phil,

Yes, this is the same Geoff Smith who wrote to me. Do you know who he is? From his comments about the RMS, he seems to be a Brit.

In his email to you, Mr. Smith notes that: "there is a strong case to be made that intermediate results, e.g., collation of such data and the relevant code should be made available in studies such as this one, since there is an important possibility of errors in trying to replicate such a collation".

This is a key point. Douglass et al. already audited our "collation" of the primary temperature data (i.e., our calculation of synthetic MSU temperatures). As I've already told Mr. Smith, Douglass et al. obtained synthetic MSU temperatures very similar to the ones published in our IJoC paper. Mr. Smith does not understand this. Nor does he understand that the algorithms used to calculate synthetic MSU temperatures from raw model temperature data have already been published and documented in the peer-reviewed literature.

I think it would be useful to raise these issues with Paul Hardaker.

Cheers,

Ben

Phil, David,

as David says I'll be away in Oklahoma first week in March. Antarctic data first piqued my interest with the Science paper on raobs trends which was clearly non-physical but hard to nail down how wrong it was. I did some minor digging into READER and found that in the UA domain it was qc'ed but not homogenised. I've made a rather rash assumption that this would also be the case for the surface data but am happy to be corrected.

Its clear to me that Antarctica is a uniquely difficult environment to collect long-term homogeneous data in. So I have substantial doubts that all the manned station pegs in Steig et al. are adequate. Does this really matter? I'm not sure.

What Steig et al., satellites, and potentially reanalyses does do is allow us, in principle, at least to get around the no-neighbours issue in assessing homogeneity away from the peninsula.

For example we could use a bootstrapping of the Steig et al approach by creating say 50 realisations of each station series using randomly seeded combinations of manned station pegs as the S et al. RegEM constraint (excluding the candidate station) to make a neighbour composite ensemble. We could then add in the available reanalysis field estimates and satellite estimates and make a reasonable punt about the existence and magnitude of any breaks based upon multiple lines of evidence (of course, we lose some of these before 1979 ...). We could use this information to assess in a more rigorous way than has been done to date the homogeneity of these sparse stations. Then cleaned up data could be fed back through Steig et al. afterwards to see how it impacts that analysis making for a nice clean self-contained study.

My understanding from the blog discussion of Steig et al. is that the analysis step is fairly trivial so such an ensemble realisation approach should be plausible with a humble PC so long as it has the coding platform available.

Of course, this doesn't resolve any fundamental methodological concerns about the S et al. approach that may exist but it does give us a reasonable chance of creating a much more homogeneous READER manned station dataset for next IPCC AR and our future products.

My suspicion is that actually changing the manned station data in this way may make S et al. more different to the straight average of the READER data as used (effectively) in AR5 and point to the importance of the long-term homogeneity of the data pegs in RegEM ... this may, of course, be felt to be a can of worms too far ...

David, Peter, Ian,

Let's go for the week with Feb 25/26 in it. I could come down for late on the 25th then spend most of the 26th discussing Ian's work and also the Antarctic ideas. Presumably John Prior and others will be available at some point on the 26th.

The Antarctic surface T data that are in CRUTEM3 have come from my searches over the years and also from READER. Much of the early stuff in READER has come from the archives here, except where BAS have got the original digitized data from the Antarctic Institutes in all the countries.

I also have some files of when some of the manned stations on the ice have moved. These are forced moves, as the station moves, but they have never been accounted for. Halley and Casey are affected.

There are issues to discuss about the AWSs and also, as David knows from AOPC, work that Wisconsin are doing in putting together all the historic US series. I've talked to them about this - mainly to try and stop them calculating mean T a different way. If they do this it will screw their series up. It all relates to them saying that the mean of min and max is not a great way in the Antarctic to calculate mean T. They say they can now do the mean of every 3 hours, but it needs the historic series and the routine updating to change at the same time - which is unlikely to happen.

Cheers

Phil

Phil

Thanks. I think Feb 25-26 is better as Peter, who suggested the Reader-data project, will be away in the first week of March. Ian will be here except, I think, on Feb 27th when he is going to a chess tournament. The hotel next to the Met Office should be OK but I haven't checked availability - that can be done when the date is chosen.

Mike,

It would be good to get some fresh blood.

Caspar and Pascal would be good choices. Discuss with Jean in Hawaii.

The meeting in Il Ciocco was a very good one - but so was the one in Wengen. It is just a matter of getting the right people and the right venue. The EGU and AGU meetings don't really work.

Cheers

Phil

At 15:41 15/02/2009, Michael Mann wrote:

thanks Jean,

yes, I've heard much about the legendary Il Ciocco meeting, sadly it was before I got into this field. I understand how you might want to discontinue being a co-convenor of this session, since its somewhat disconnected from the recent directions of your research. In fact, perhaps we should consider recruiting entirely new, more junior scientist conveners to take this over. Perhaps e.g. Caspar and Pascal.

Phil--interested in your thoughts on this.

Jean--looking forward to seeing you in Hawaii!

mike

On Feb 15, 2009, at 6:07 AM, Jean Jouzel wrote:

Dear mike and Phil,

This looks quite good (including poster presentations).

I confirm that I will be unable to attend this year (IPCC plenary in Turkey this same week). I hope that it will be better next year.

As you can see, I'am less and less involved in studies dealing with the last millenium. Obviously, I have still a lot of interest since the NATO meeting we organized at Il Ciocco with Ray Bradley and Phil about the climate of the 2000 years (and a great pleasure to interact with both of you). But, as far as our session, it may be wise to think of someone more directly invoved for the coming years.

You certainly have names in mind and this would be very welcome (one of my suggestion could be Pascal Yiou).

I'am sorry not to be with you in Vienna but I will be in Hawaii (Mike I feel that you will be there too).

Cheers Jean

At 9:07 +0000 13/02/09, Phil Jones wrote:

Mike, Jean,

I won't be in Hawaii. I did register, but I've just been travelling too much and have more meetings coming up in late March and April. I've decided not to go to the AGU in Toronto, partly as I couldn't find a replacement for a keynote talk I've been down to give at a meeting in Finland on the same day. Apparently about 5 of the 30 AGU Fellows listed can't make it either.

As for the EGU, the session looks good. Pity you have got Friday - numbers will be quite low for the poster session in the late afternoon. The one thing to add in would be Chairpersons for the two oral sessions. I managed to get them in last year, but can't recall how. If I recall correctly Jean said he had an IPCC meeting, so maybe put Gene down as chairing the first morning slot. Nick would be another option. Assume you'll do the second morning slot.

Cheers

Phil

At 03:09 13/02/2009, Michael Mann wrote:

Hi Phil, Jean,

I've attached the final version of our session program. They allowed us a half day or oral sessions (12 15 minute talks, 4 were solicited), and the rest are in poster.

Please let me know if you see any problems. I think its still possible to make changes if absolutely necessary.

thanks,

mike

p.s. will I see either of you at the IPCC meeting in Hawaii in March?

On Feb 9, 2009, at 8:12 AM, Phil Jones wrote:

Jean,

I think he is as well.

Dear Mr Jouzel,

The Programme Group Chairs of the EGU2009 scheduled your following
Session:

CL10

Climate of the last millennium: reconstructions, analyses and
explanation of regional and seasonal changes

Now you are kindly asked to finalize the actual programme of your
Session from 10 Feb 2009 to 14 Feb 2009. Please enter the tool

SOIII - Presentation Selection at

[6]<http://meetingorganizer.copernicus.org/EGU2009/sessionmodification/218> by using your
Copernicus Office User ID 100391.

The following tasks should be taken into account:

- 1) subdivide your Abstracts into Oral and Poster presentations;
- 2) define the sequence and the length of the different Oral presentations;
- 3) define the sequence of the Poster presentations;
- 4) define chairpersons.

In addition, you are able to include subtitles. These may
structure your programme, or define events without a corresponding
contribution, e.g. 5 min. "Introduction" or "Discussion".

Your entries generate the draft programme which will be finally
approved by the Programme Group Chairs and published online
afterwards. The authors will then receive the Letter of Schedule,
informing them about the details of their presentation.

We thank you very much in advance for your cooperation, and please
do not hesitate to contact us in case that any questions may arise!

With kind regards,
Katja Gänger

Hi Phil, Jean,
I've attached the final version of our session program. They allowed us a half day or
oral sessions (12 15 minute talks, 4 were solicited), and the rest are in poster.
Please let me know if you see any problems. I think its still possible to make changes
if absolutely necessary.
thanks,
mike
p.s. will I see either of you at the IPCC meeting in Hawaii in March?

Dear Mr Jouzel,

The Programme Group Chairs of the EGU2009 scheduled your following Session:

CL10

Climate of the last millennium: reconstructions, analyses and explanation of regional
and seasonal changes

Now you are kindly asked to finalize the actual programme of your Session from 10 Feb
2009 to 14 Feb 2009. Please enter the tool SOIII - Presentation Selection

at[18]<http://meetingorganizer.copernicus.org/EGU2009/sessionmodification/218> by using
your Copernicus Office User ID 100391.

The following tasks should be taken into account:

- 1) subdivide your Abstracts into Oral and Poster presentations;
- 2) define the sequence and the length of the different Oral presentations;
- 3) define the sequence of the Poster presentations;
- 4) define chairpersons.

In addition, you are able to include subtitles. These may structure your programme, or define events without a corresponding contribution, e.g. 5 min. "Introduction" or "Discussion".

Your entries generate the draft programme which will be finally approved by the Programme Group Chairs and published online afterwards. The authors will then receive the Letter of Schedule, informing them about the details of their presentation.

We thank you very much in advance for your cooperation, and please do not hesitate to contact us in case that any questions may arise!

With kind regards,

Katja Gänger

<x-flowed>

Great. I'll play with both the composite series and the three individuals. I was hoping to get some spatially distributed information, so might include all three. I will also subdivide by proxy time and use PCA to examine spatial patterns. I'll take a stab at revising the text to include a few sentences about how we chose the tree-ring series. Then maybe you can take a look on Monday. Have a good weekend. Darrell

Hi Keith, Phil and Tim,

Please find attached an outline bid for the NERC Consortium bid we discussed at the end of last year. I must apologise for the delay in getting back to you. Exeter has suddenly gone mad with appointments of staff and postgrads. It's all good fun but it's taken up a lot of my time over the past couple of months.

For a NERC Consortium we need to put in a 2 page document as an expression of interest. If approved we can then go forward for submission. The next deadline is 1 July.

Can you have a look at the attached and let me know what you think? Could you let me know what sort of support you'd need if we go forward. We have up to £3.5 million to spend over 5 years. Included in the document we have to include a summary of the funding we'd like to get from NERC, any other funds we have in support and other benefits e.g. training. For the latter we envisaged approximately 1 postdoc and 2 PhDs per UK institution.

I'm currently in Copenhagen for a meeting so my email contact will be a little erratic but am back Friday.

Hope things are going well.

All the best,

Chris

Slartibartfast: Science has achieved some wonderful things of course, but I'd far rather be happy than right any day.

Arthur Dent: And are you?

Slartibartfast: No. Thats where it all falls down of course.

Arthur Dent: Pity. It sounded like quite a good lifestyle otherwise.

Slartibartfast: Science has achieved some wonderful things of course, but I'd far rather be happy than right any day.

Arthur Dent: And are you?

Slartibartfast: No. That's where it all falls down of course.
Arthur Dent: Pity. It sounded like quite a good lifestyle otherwise.

Dear Keith,

I'm very sorry to hear that both you and Sarah have not been well. I hope that both of you are feeling better soon. While I understand your decision, it's very sad that you won't be there on June 19th. I was really looking forward to a reunion of the "CRU gang". Despite its relatively small size, CRU has had (and continues to have!) a rather remarkable "fingerprint" in the world of climate science. The times we spent together while Tom was Director of CRU were exciting and extraordinary. It would have been fun to get together and celebrate those times, and to celebrate CRU's achievements under Tom's leadership.

Once again, best wishes to you and Sarah. Get well soon, and please let me know if you reconsider.

With best regards,

Ben

Keith Briffa wrote:

> Ben and Phil
> Sorry but I am going to decline the invitation. You will know the respect I have for Tom and the high personal regard I have for him. I will send him a personal message explaining my decision. Sorry for the time it has taken to come to this decision but I had to think hard about it . At this moment I do not know whether Sarah will make it. She like me has not been well over the Christmas/New Year period but she has not yet managed a single day back at work yet. I will have to leave it to her to let you know her thoughts on this.

Gavin, Mike,

See the link below! Don't alert anyone up to this for a while. See if they figure it out for themselves.

I've sent this to the Chief Exec of the RMS, who said he was considering changing data policy with the RMS journals. He's away till next week. I just wanted him to see what a load of plonkers he's dealing with! I'm hoping someone will pick this up and put it somewhere more prominently.

The responses are even worse than you get on CA.

I've written up the London paper for the RMS journal Weather, but having trouble with their new editor. He's coming up with the same naive comments that these responders are. He can't understand that London has a UHI of X, but that X has got no bigger since 1900.

I'm away all next week.

Cheers

Phil

Mike,

I want to get the more extensive London paper in first.
I hope my missive to the Chief Exec of the RMS does something next week.
By the way the HC doesn't have a Director.
John Mitchell is Head of Climate Science
Chris Gordon is Deputy Director of the HC.
It has never had a Director with that particular title.
It is impossible for anyone to find this on their web site. Only if you
were on the HC Scientific Review Group would you be aware.

Cheers

Phil

Ben,

I don't know whether they even had a meeting yet - but I did say I would send something to their Chief Exec.

In my 2 slides worth at Bethesda I will be showing London's UHI and the effect that it hasn't got any bigger since 1900. It's easy to do with 3 long time series. It is only one urban site (St James Park), but that is where the measurements are from. Heathrow has a bit of a UHI and it has go bigger.

I'm having a dispute with the new editor of Weather. I've complained about him to the RMS Chief Exec. If I don't get him to back down, I won't be sending any more papers to any RMS journals and I'll be resigning from the RMS.

The paper is about London and its UHI!

Cheers

Phil

At 16:48 19/03/2009, you wrote:

Thanks, Phil. The stuff on the website is awful. I'm really sorry you have to deal with that kind of crap.

If the RMS is going to require authors to make ALL data available - raw data PLUS results from all intermediate calculations - I will not submit any further papers to RMS journals.

Cheers,

Ben

Phil Jones wrote:

Paul,

I sent you this last night, but in another email. I should have sent you two emails - apologies. The issues were not linked. This email is to bring your attention to the link at the end.

The next few sentences repeat what I said last night. I had been meaning to email you about the RMS and IJC issue of data availability for numbers and data used in papers that appear in RMS journals. This results from the issue that arose with the paper by Ben Santer et al in IJC last year. Ben has made the data available that this complainant wanted. The issue is that this is intermediate data. The raw data that Ben had used to derive the intermediate data was all fully available. If you're going to consider asking authors to make some or all of the

data available, then they had done already. The complainant didn't want to have to go to the trouble of doing all the work that Ben had done.

I hope this is clear.

Another issue that should be considered as well is this.

With many papers, we're using Met Office observations. We've abstracted these from BADC to use them in the papers. We're not allowed to make these available to others. We'd need to get the Met Office's permission in all cases.

This email came overnight - from Tom Peterson, who works at NCDC in Asheville.

[1][http://](http://wattsupwiththat.com/2009/03/18/finally-an-honest-quantification-of-urban-warming-by-a-major-climate-scientist/)

wattsupwiththat.com/2009/03/18/finally-an-honest-quantification-of-urban-warming-by-a-major-climate-scientist/

"Phil Jones, the director of the Hadley Climate Center in the UK."

We all know that this is not my job. The paper being referred to appeared in JGR last year. The paper is

Jones, P.D., Lister, D.H. and Li, Q., 2008: Urbanization effects in large-scale temperature records, with an emphasis on China. /J. Geophys. Res/. *113*, D16122, doi:10.1029/2008/JD009916.

The paper clearly states where I work - CRU at UEA. There is no mention of the Hadley Centre!

There is also no about face as stated on the web page.

Sending this as it gives a good example of the sort of people you are dealing with when you might be considering changes to data policies at the RMS.

Several years ago I decided there was no point in responding to issues raised on blog sites. Ben has made the same decision as well.

There are probably wider issues due to climate change becoming more main stream in the more popular media that the RMS might like to consider. I just think you should be aware of some of the background. CRU has had numerous FOI requests since the beginning of 2007. The Met Office, Reading, NCDC and GISS have had as well - many related to IPCC involvement. I know the world changes and the way we do things changes, but these requests and the sorts of simple mistakes, should not have an influence on the way things have been adequately dealt with for over a century.

Cheers

Phil

<x-flowed>

Dear friends,

The scoping of IPCC AR5 will happen in July this year. In the community there have been opinions raised regarding paleo-science in the next report, e.g. whether to have paleo-science dispersed into various topical chapters, e.g. forcing, model-evaluation, sea level etc., or whether it might be best to do as in AR4 to have a separate Paleo-chapter.

There are good arguments for both options, and it is not the intent of this email to voice a specific opinion. Rather it is important to let the scoping process be aware of all the relevant new paleo-science which would be assessed in AR5, thereby leading to the need for a strong presence of paleoclimate scientists in the LA-team of AR5, particularly in WG1, but also in WG2.

In order to make the case that paleo-science continues to be highly relevant for IPCC, Peck and I have agreed to be the editors of a Slide-series (ppt style) which can be used to make the case in the scoping, and which of course could be a useful product for various outreach activities of PAGES and the paleoclimate community at large. The PAGES office will assist in producing the slides

We therefore send this email to you who worked as LAs in AR4 or who are on SSC or other relevant PAGES panels and ask for your input. What we hope you can help with is the following:

1. Provide your best examples of key new IPCC (Policy) relevant new

results post AR4, i.e. accepted after July 2006, that provide compelling arguments for paleoclimate science as a key contributor to IPCC. Please limit this to the results which are clearly IPCC-relevant

2. Ongoing projects or programmes that are likely to deliver such results in the next 2-3 years can also be included. The information must, however, be specific and compelling to a non-paleo audience.
3. Send PDF of the paper or other material (like ppt slide) to Peck (jto@u.arizona.edu), Myself and Thorsten Kiefer (thorsten.kiefer@pages.unibe.ch) at PAGES, preferably by May 2.

We think this might become a very useful service to our community and to the climate change communities at large, and will be very rewarding. Hoping to hear back from many of you.

Best wishes

Peck and Eystein

Hi Eystein and Jonathan,

With respect to the question of a separate paleo-climate chapter: if
paleoclimate is an
adjunct to all of the other chapters, what would happen - would there
be a paleo-climate
person on each of those chapters, just for that component? If so, the
person would not
carry much influence - and if chapters had to be trimmed (which we
know always happens),
there's a chance that a lot of the paleoclimate aspect would be the
first to go. I'm afraid
that little in-depth discussion would survive.

On the other hand: now that there's been a paleoclimate chapter, a lot
of the
'introductory' material would not really be needed - just the
'updates', which make for
much fewer pages. Perhaps, then, paleoclimate observations could be
part of the climate
observation chapter; and paleoclimate modeling, part of the modeling
chapter. That way, at
least several people with paleoclimate heritage could be part of each
of these chapters,
and allow for a proper representation of the state of our
understanding in these areas. It
would also allow for better integration of paleoclimates with the
current climate. As in
the case of present climate, care would have to be taken to ensure
that the observations

and modeling chapters have strong linkages.

Concerning what new topic should be addressed: there should be a discussion about the use of paleoclimates as analogs for the future. Some scientists (including at least one at GISS) are certain of their utility in this regard. I think the topic should be addressed from all sides.

And as for 'new' paleoclimate work: we have an article about to come out in GRL on stratospheric ozone during the LGM; here's the link:

Dear all,

I guess one point that can be outlined for the next IPCC report is
about the regional
differences in climate change and variability.

We can see that in the paleo record, and it is very clear from the
work of the PAGES "last
2k regional groups".

There is for instance a new Arctic 2k summary in Journal of
Paleolimnology (Kauffman et al
2009), and another paper in prep (I guess you are co-author Peck).

All the best

Pierre

Thanks Steve and friends I still need to read all the feedback, and appreciate it. I think you hit on a biggie that paleo provides critical evaluations of model realism. With regard to the others, the key for inclusion in an IPCC assessment, is to synthesize the published literature in a way that informs policy makers (the top audience) on what is happening in the climate system, and more important even what will happen in the climate system. Taking the terrific speleothem work for example, what are the key lessons that are NEW and important to highlight to policy makers? This is the kind of relevant science we need to compile/highlight. It's harder than at first glance, but that's ok quality of relevant issues is more important than quantity. Again, thanks all for taking this exercise seriously. Feel free to seek input from colleagues, although please help us by only sending what you think has a chance of fitting with the criteria above it is unclear if there will be time for anyone to read all the strong literature that has come out since mid-2006, so please summarize each key point with a couple sentence bullet, the complete reference (maybe even send the pdf), and if you think the key point isn't easy to understand to a non-paleo person T a little (e.g., para) supporting text, w/ a key figure if you think it really helps. Best, peck
On 4/16/09 1:48 PM, "Steve Colman" <[8]scolman@d.umn.edu> wrote:

Dear Peck and Eystein,
I tend to agree with Stefan that it would be conceptually nice to weave paleo-science into all the chapters of the next report, but that, as a practical matter, a tighter

focus on paleo results would have more impact. Most people seem to accept that past

history is the only way to assess what the climate system can actually do (e.g., how

fast it can change). However, I think that the fact that reconstructed history provides

the only calibration or test of models (beyond verification of modern simulations) is under-appreciated.

In terms of recent or near-future new results, I think that two areas of continental

paleoclimate research are exciting: (1) the new speleothem records, which are producing

extremely high-resolution, well-dated histories, especially in monsoon areas; and (2) the

network of long-term continental climate histories coming from drill cores in lakes

(Titicaca, Malawi, Bosumtwi, Peten Itza, Qinghai, El' gygytgyn) is reaching the point

where stimulating syntheses may be possible.

<x-flowed>
Phil,

Do you know where this stands? The key things from the Peiser items are ...

"Wang had been claiming the existence of such exonerating documents for nearly a year, but he has not been able to produce them. Additionally, there was a report published in 1991 (with a second version in 1997) explicitly stating that no such documents exist. Moreover, the report was published as part of the Department of Energy Carbon Dioxide Research Program, and Wang was the Chief Scientist of that program."

and

"Wang had a co-worker in Britain. In Britain, the Freedom of Information Act requires that data from publicly-funded research be made available. I was able to get the data by requiring Wang's co-worker to release it, under British law. It was only then that I was able to confirm that Wang had committed fraud."

You are the co-worker, so you must have done something like provide Keenan with the DOE report that shows that there are no station records for 49 of the 84 stations. I presume Keenan therefore thinks that it was not possible to select stations on the basis of ...

"... station histories: selected stations have relatively few, if any, changes in instrumentation, location, or observation times"
[THIS IS ITEM "X"]

Of course, if the only stations used were ones from the 35 stations that *did* have station histories, then all could be OK. However, if some of the stations used were from the remaining 49, then the above selection method could not have been applied (but see below) -- unless there are other "hard copy" station history data not in the DOE report (but in China) that were used. From what Wang has said, if what he says is true, the second possibility appears to be the case.

What is the answer here?

The next puzzle is why Wei-Chyung didn't make the hard copy information available. Either it does not exist, or he thought it was too much trouble to access and copy. My guess is that it does not exist -- if it

did then why was it not in the DOE report? In support of this, it seems that there are other papers from 1991 and 1997 that show that the data do not exist. What are these papers? Do they really show this?

Now my views. (1) I have always thought W-C W was a rather sloppy scientist. I therefore would not be surprised if he screwed up here. But ITEM X is in both the W-C W and Jones et al. papers -- so where does it come from first? Were you taking W-C W on trust?

(2) It also seems to me that the University at Albany has screwed up. To accept a complaint from Keenan and not refer directly to the complaint and the complainant in its report really is asking for trouble.

(3) At the very start it seems this could have been easily dispatched. ITEM X really should have been ...

"Where possible, stations were chosen on the basis of station histories and/or local knowledge: selected stations have relatively few, if any, changes in instrumentation, location, or observation times"

Of course the real get out is the final "or". A station could be selected if either it had relatively few "changes in instrumentation" OR "changes in location" OR "changes in observation times". Not all three, simply any one of the three. One could argue about the science here -- it would be better to have all three -- but this is not what the statement says.

Why, why, why did you and W-C W not simply say this right at the start? Perhaps it's not too late?

I realise that Keenan is just a trouble maker and out to waste time, so I apologize for continuing to waste your time on this, Phil. However, I *am* concerned because all this happened under my watch as Director of CRU and, although this is unlikely, the buck eventually should stop with me.

Best wishes,
Tom

P.S. I am copying this to Ben. Seeing other peoples' troubles might make him happier about his own parallel experiences.

CLIMATE SCIENCE FRAUD AT ALBANY UNIVERSITY?

The University at Albany is in a difficult position. If the University received such records as part of the supposed misconduct investigation, then they could easily resolve the problem by making them available to the scientific community and to readers. If the University does not have such records then they have been complicit in misconduct and in coverup of misconduct. If the University at Albany does have such records, but such records are not in accordance with the stated methodology of the publications, then the University has more serious difficulties.

"Investigations" of scientific misconduct should themselves align with the usual principles of scientific discourse (open discussion, honesty, transparency of method, public disclosure of evidence, open public analysis and public discussion and reasoning underlying any conclusion). This was not the case at the University at Albany. When you see universities reluctant to investigate things properly, it provides reasonable evidence that they really don't want to investigate things properly.

(1) ALLEGATIONS OF FRAUD AT ALBANY - THE WANG CASE

Scientific Misconduct Blog, 2 May 2009

<http://scientific-misconduct.blogspot.com/2009/05/allegations-of-fraud-at-albany-wang.html>

Aubrey Blumsohn

Professor Wei-Chyung Wang is a star scientist in the Atmospheric Sciences Research Center at the University at Albany, New York. He is a key player in the climate change debate (see his self-description here). Wang has been accused of scientific fraud.

I have no inclination to "weigh in" on the topic of climate change. However the case involves issues of integrity that are at the very core of proper science. These issues are the same whether they are raised in a pharmaceutical clinical trial, in a basic science laboratory, by a climate change "denialist" or a "warmist". The case involves the hiding of data, access to data, and the proper description of "method" in science.

The case is also of interest because it provides yet another example of how *not* to create trust in a scientific misconduct investigation. It adds to the litany of cases suggesting that Universities cannot be allowed to investigate misconduct of their own star academics. The University response has so far been incoherent on its face.

Doug Keenan, the mathematician who raised the case of Wang is on the "denialist" side of the climate change debate. He maintains that "almost by itself, the withholding of their raw data by [climate] scientists tells us that they are not scientists".

Below is my own summary of the straightforward substance of this case. I wrote to Wei-Chyung Wang, to Lynn Videka (VP at Albany, responsible for the investigation), and to John H. Reilly (a lawyer at Albany) asking for any correction or comments on the details presented below. My request was acknowledged prior to publication, but no factual correction was suggested.

Case Summary

The allegations concern two publications. These are:

Jones P.D., Groisman P.Y., Coughlan M., Plummer N., Wang W.-C., Karl T.R. (1990), "Assessment of urbanization effects in time series of surface air temperature over land", *Nature*, 347: 169-172. (PDF here)

Wang W.-C., Zeng Z., Karl T.R. (1990), "Urban heat islands in China", *Geophysical Research Letters*, 17: 2377-2380. (PDF here)

The publications concern temperature at a variety of measuring stations over three decades (1954-1983). Stations are denoted by name or number. A potential confounder in such research is that measuring stations may be moved to different locations at different points in time. It is clearly important that readers of publications understand the methodology, and important confounders.

The publications make the following statements:

(Statement A) "The stations were selected on the basis of station history: we chose those with few, if any, changes in instrumentation, location or observation times." [Jones et al.]

(Statement B) "They were chosen based on station histories: selected stations have relatively few, if any, changes in instrumentation, location, or observation times." [Wang et al.]

The publications refer to a report produced jointly by the U.S. Department of Energy (DOE) and the Chinese Academy of Sciences (CAS) which details station moves, and the publications further suggest that stations with few if any moves or changes were selected on the basis of that report. However:

Of 84 stations that were selected, Keenan found that information about only 35 are available in the DOE/CAS report

Of those 35 stations at least half did have substantial moves (e.g. 25 km). One station had five different locations during 1954-1983 as far as 41 km apart.

It therefore appears that Statements A and B must be false. If false, readers would have been misled both in terms of the status of the stations and the manner in which they had been selected (or not selected).

Keenan then communicated with the author of one of the publications (Jones) to ask about the source of location information pertaining to the other 49 stations that had not been selected using the described methodology. Jones informed Keenan that his co-author Wang had selected those stations in urban and rural China based on his "extensive knowledge of those networks".

On 11 April 2007 Keenan E-mailed Wang, asking "How did you ensure the quality of the data?". Wang did not answer for several weeks, but on 30 April 2007 he replied as follows:

"The discussion with Ms. Zeng last week in Beijing have re-affirmed that she used the hard copies of station histories to make sure that the selected stations for the study of urban warming in China have relatively few, if any, changes in instrumentation, location, or observation times over the study period (1954-1983)"

Keenan points out that the "hard copies" to which Wang refers were not found by the authors of the DOE/CAS report, who had endeavored to be "comprehensive" (and that the DOE/CAS report was authored in part by Zeng, one of the co-authors on Wang). Keenan further notes that any form of comprehensive data covering these stations during the Cultural Revolution would be implausible.

In August 2007 Keenan submitted a report to the University at Albany, alleging fraud. Wang could at that stage have made the "hard copy" details of the stations selected available to the scientific community. However, he failed to do so.

In May 2008, the University at Albany wrote to Keenan that they had conducted an investigation and asked him to comment on it (see the rather odd letter). However they refused to show him the report of the investigation or any of the evidence to allow any comment (further odd letter).

In August 2008 the University sent Keenan an astonishing letter of "determination" stating that they did not find that Wang had fabricated data, but that they refused to provide any investigation report or any other information at all because "the Office of Research Integrity regulations preclude discussion of any information pertaining to this case with others who were not directly involved in the investigation".

Wang has still not made the station records available to the scientific community. If he provided such records to the University as part of a misconduct investigation, then the University has apparently concealed them.

Comments

In the absence of any explanation to the contrary, it seems that the methodology for station selection as described in these two publications was false and misleading.

Wang maintains that hard copy records do exist detailing the location of stations selected by himself outwith the published methodology. However the refusal to clarify "method" is inappropriate and a form of misconduct in and of itself. It does not lend credence to Wang's assertion that fraud did not take place. It would also be necessary to see records of stations that were not selected, in order to confirm that selection was indeed random, and only "on the basis of station history".

The University at Albany is in a difficult position.

If the University received such records as part of the supposed misconduct investigation, then they could easily resolve the problem by making them available to the scientific community and to readers.

If the University does not have such records then they have been complicit in misconduct and in coverup of misconduct.

If the University at Albany does have such records, but such records are not in accordance with the stated methodology of the publications, then the University has more serious difficulties.

"Investigations" of scientific misconduct should themselves align with the usual principles of scientific discourse (open discussion, honesty, transparency of method, public disclosure of evidence, open public analysis and public discussion and reasoning underlying any conclusion). This was not the case at the University at Albany. When you see universities reluctant to investigate things properly, it provides reasonable evidence that they really don't want to investigate things properly.

For further information on this case see here and here.

(2) THE FRAUD ALLEGATION AGAINST SOME CLIMATIC RESEARCH OF WEI-CHYUNG WANG

Informath, April 2009
<http://www.informath.org/apprise/a5620.htm>

Douglas J. Keenan

Following are some remarks about my exposé, "The fraud allegation against some climatic research of Wei-Chyung Wang".

Wei-Chyung Wang is a professor at the University at Albany, State University of New York. He has been doing research on climate for over 30 years, and he has authored or co-authored more than 100 peer-reviewed scientific articles. He has also received an Appreciation Plaque from the Office of Science in the U.S.A., commending him, "For your insightful counsel and excellent science." The plaque resulted in particular from his research on global warming.

I have formally alleged that Wang committed fraud in important parts of his global-warming research. Below is a relevant timeline.

03 August 2007 My report, "Wei-Chyung Wang fabricated some scientific claims", is sent to the Vice President for Research at Wang's university.

31 August 2007 The university notifies me that it is initiating an inquiry into suspected research misconduct by Wang. (The notification includes a copy of the university's Policy and Procedures on Misconduct in Research and Scholarship.)

12 November 2007 My exposé on Wang's alleged fraud is published (reference below).

07 December 2007 Myself and the university's Inquiry Committee have a conference call.

20 February 2008 The university sends me the Report of the Inquiry Committee. The Committee unanimously concluded that "there was no data" (thus implicitly concluding Wang must have fabricated data) and that a full investigation should be undertaken.

23 May 2008 The university sends me a notice: the Investigation Committee has completed its work and found no evidence of fraud. The investigation was conducted without interviewing me, which is a violation of the university's policy. The university asks me to comment on the Committee's report; I am, however, not allowed to see the report.

04 June 2008 The university informs me that I am not allowed to see the report because they did not interview me when preparing it.

06 June 2008 I submit comments to the university, listing ways in which I believe the university has acted in breach of U.S. regulations and its own policy.

11 July 2008 I submit a complaint to the Public Integrity Bureau at the Office of the Attorney General of New York State, alleging criminal fraud.

12 August 2008 The university sends me the determination for its investigation, saying that there is "no evidence whatsoever [of] any research misconduct".

07 October 2008 I telephone the Public Integrity Bureau and am told that it might be some months before the Bureau begins to review the complaint.

17 March 2009 I telephone the Public Integrity Bureau and am told that the complaint is under review by an attorney.

18 March 2009 I file three requests under the Freedom of Information Law of New York State: for a copy of the full report by the Inquiry Committee; for a copy of the full report by the Investigation Committee; and, given that the relevant federal funding agencies are required to be notified when a misconduct investigation is initiated, for copies of all such notifications that were sent by the university and pertain to the investigation of Wang.

24 March 2009 Given that Wang received funding for the fraudulent research from the U.S. Department of Energy (DOE) and that the DOE has since supplied more funding to Wang, I report the fraud and the university's apparent cover up to the Office of Inspector General at the DOE.

This web page will be updated with news about the case, as the investigations progress.

=====

(3) KAFKA AT ALBANY

Freeborn John, 15 March 2009

<http://freebornjohn.blogspot.com/2009/03/kafka-at-albany.html>

Peter Risdon

Last June I reported on the allegations of academic fraud levelled by a British mathematician, Doug Keenan, against Professor Wei-Chyung Wang of New York State University at Albany.

Dr Keenan alleged that in work that has come to be widely cited in climate studies, work that included the collation of data from temperature measuring stations in China, Professor Wang made statements that "cannot be true and could not be in error by accident. The statements are fabricated."

In August 2007, Dr Keenan submitted a report (pdf) of his allegations to the Vice President for Research at Wang's university and an inquiry was initiated. In February 2008 this was escalated into a full investigation by the Inquiry Committee.

All this was summarised in my earlier post, together with quotations from Dr Keenan's allegation.

So far, things had run as might be expected. A fraud had been alleged, the University at Albany looked into it and decided to hold a formal investigation. Dr Keenan waited to be contacted by the investigation and asked to put his case, in line with the university's Policy and Procedures on Misconduct in Research and Scholarship (.doc). The relevant section of this document runs as follows (emphasis added):

III. A. Rights and Responsibilities of the Complainant

Rights: The Vice President for Research will make every effort to ensure the privacy and confidentiality of complainants. The University will protect, to the maximum extent possible, the position and the reputation of those who in good faith report alleged misconduct in research.

The Vice President for Research will work to ensure that complainants will not be retaliated against in the terms and conditions of their employment or other status at the University and will review instances of alleged retaliation for appropriate action. Any alleged or apparent retaliation should be reported immediately to the Vice President for Research.

The complainant will be provided a copy of the formal allegations when and if an inquiry is opened. The complainant will have the opportunity to review portions of the inquiry and investigation reports pertinent to the complainant's report or testimony, and will be informed in writing of the results of the inquiry and investigation, and of the final determination. After the final determination and upon request to the Vice

President for Research, the complainant shall be given access to the full documentation.

Responsibilities: The complainant is responsible for making allegations in good faith, maintaining confidentiality, and cooperating fully with an inquiry and/or investigation.

Dr Keenan lived up to the responsibility as stated in the final paragraph above so far as he could. He had made the allegation in good faith and given Professor Wang an opportunity to explain how he had reached his results, an opportunity the Professor had not taken. Keenan maintained confidentiality. In order to cooperate with the investigation, though he would first have to be contacted by it. Dr Keenan waited.

Late in May 2008 a communication arrived from Albany. It said:

After careful review of the evidence and thoughtful deliberation, the Investigation Committee finds no evidence of the alleged fabrication of results and nothing that rises to the level of research misconduct having been committed by DR. Wang.

As the institutional official responsible for this case, I have accepted the Committee's findings and the Report. You have fourteen (14) calendar days from the date of this letter to provide any comments to add to the report for the record.

Contrary to its own rules, the Committee had not given Keenan the opportunity to "review portions of the inquiry and investigation reports".

That's astonishing, but here's where it becomes Kafkaesque. Keenan was being asked, in this most recent communication, to comment on the report of the Committee. But he was not sent a copy of the report. When he challenged this, he received an email from Adrienne Bonilla explaining that:

[Keenan] did not receive a copy of the Investigation report because the report did not include portions addressing your role and opinions in the investigation phase.

Per the UAlbany Misconduct policy:

VI. E. Investigation Report and Recommendations of the Vice President for Research

"...The Vice President for Research will provide the respondent with a copy of the draft investigation report for comment and rebuttal and will provide the complainant with those portions of the draft report that address the complainant's role and opinions in the investigation. The respondent and complainant will be given 14 calendar days from the transmission of the report to provide their written comments. Any written responses to the report by either party will be made part of the report and record.

Keenan then wrote to the Vice President for Research at Albany, Lynn Videka, pointing out the various ways in which the University had breached its own policy, stating that its behaviour was consistent with a cover up, and pointing out that Professor Wang has received more than \$7 million in grants from a couple of US federal agencies.

In August 2008, Lynn Videka wrote to Keenan enclosing a final copy of a "determination" of the investigation. In her covering note, she stated:

I am notifying you of the case outcome because you were the complainant in this case. The University's misconduct policies and the Office of Research Integrity regulations preclude discussion of any information pertaining to this case with others who were not directly involved in the investigation.

To summarise, the university initiated an investigation, then broke its own rules by not involving Dr Keenan. It then produced a report that carefully avoided mentioning Dr Keenan, so it could claim he was not entitled to see a copy of this report. It then asked Keenan to comment on the report. It has completely disregarded its own policy that "After the final determination and upon request to the Vice President for Research, the complainant shall be given access to the full documentation."

But Doug Keenan is a tenacious man. In July 2008, after being refused sight of the report, he submitted a formal complaint (pdf) to the Public Integrity Bureau at the Office of the Attorney General of New York State, alleging criminal fraud. In this complaint, he said:

Wei-Chyung Wang is a professor at the University at Albany, State University of New York. He has been doing research for over 30 years. For this research, Wang has received at least \$7 million. The funds have come primarily from the Department of Energy, with additional funding from other federal agencies (DOD, FAA, NSF). I have formally alleged that Wang committed fraud in important parts of his research. My allegation was submitted to the University at Albany; a copy is enclosed.

The university conducted a preliminary inquiry; a copy of the report from the inquiry is enclosed (redacted, by the university). Briefly, Wang claimed that there were some documents that could exonerate him. The inquiry concluded that there should be a full investigation, which should be charged with obtaining and reviewing any such additional evidence ... so that a final resolution may be made regarding the allegation against Dr. Wang.

Wang had been claiming the existence of such exonerating documents for nearly a year, but he has not been able to produce them. Additionally, there was a report published in 1991 (with a second version in 1997) explicitly stating that no such documents exist. Moreover, the report was published as part of the Department of Energy Carbon Dioxide Research Program, and Wang was the Chief Scientist of that program.

The university conducted an investigation. The investigation concluded that Wang is innocent. I believe that the case against Wang is strong and clear, and that the university is trying to cover up the fraud so as to

protect its reputation. Wang is one of the university's star professors. The conduct of the investigation violated several of the university's own stated policies: details are given in an attached e-mail (dated 06 June 2008).

The e-mail was sent to Lynn Videka, Vice President for Research at the university: Videka was in charge of overseeing the investigation. Note, in particular, that the documents that Wang was relying on were never produced.

I have only examined a little of Wang's research; so I do not know the full extent of the fraud. It is difficult to examine more in part because Wang has not willingly made his data available: when asked for the data from the research that I later reported as fraudulent, Wang refused. For that research, though, Wang had a co-worker in Britain. In Britain, the Freedom of Information Act requires that data from publicly-funded research be made available. I was able to get the data by requiring Wang's co-worker to release it, under British law. It was only then that I was able to confirm that Wang had committed fraud. Details are given in my report to the university (page 4, last paragraph). I would be willing to help examine other research that Wang has done, if more data were made available.

There was another case of research fraud with a professor at the University of Vermont, in 2005. There, Prof. Eric Poehlman was convicted of making false statements on federal grant applications; he was sentenced to a year and a day in prison. Wang has done the same as Poehlman. The fraudulent work described in my report dates from 1990; Wang has been relying on that work in some of his grant applications since then. As I understand things, each of those applications is a violation of statute. (Additionally, Wang has been using the grants to go on frequent trips to China.)

In October 2008 Dr Keenan was told there could be a wait of several months while his complaint is investigated.

I'll let you know when there are any further developments.

UPDATE: I didn't mention this in the main piece above, but I did mail the relevant person at Albany myself, some time ago, asking for news of the investigation against Professor Wang. I received no reply.

However, within a couple of hours of this being posted, someone at Albany came to look at it, from the host `aspmi-cc326.cc.albany.edu` (169.226.172.35), having apparently been sent an email about it.

So even if they are not communicative about this case, it seems someone at Albany is keeping their eyes open for reports of it.

UPDATE: On reflection, the hit from Albany is also consistent with someone using Google Alerts to monitor coverage of this issue.

UPDATE: Doug Keenan has been told on the telephone that this case is now under review by an attorney at the OAG Public Integrity Bureau.

UPDATE: Also see new findings on the effect of urban warming.

Subject: CRUTEM4
Date: Tue, 12 May 2009 08:54:44 +0100

Phil,

there may be some money this FY, substantial sums. Management here are casting around for ideas. As its to be spent this FY its largely going to be consultant work as we never have a cats chance in hell of recruiting on that timescale. What resource do you think we could contract from CRU (you, Harry, others?) for doing a CRUTEM4 which I would maintain had two aims ...

1. Rescue and incorporation of recent data (I'm pinging NCDC too to see what they could do vis-a-vis collating and sending the non-wmo US stations and other data you may not have ... their bi-lats may have sig. extra stations for Iran, Aus, Canada etc.)

2. A more robust error model that led to production of a set of equi-probable potential gridded products (HadSST3 will do simmilarly so we could combine to form HadCRUT4 equi-probable). This error model determination would ideally be modular so that we could assess how wrong our assumptions about the error would have to be to "matter" and what error sources are important for our ability to characterise the long-term trend (trivially these will be the red noise I know but then most people seem blind to the trivial sadly ...). The HadCRUT3 paper clearly started well down that path but a recent paper I had the displeasure of reviewing on my way back from WMO shows its poorly understood (deliberately so in this particular case ...).

We have a meeting Thursday. If it passes muster there we'll put it to DECC and see what happens. No promises.

This would mean we'd have HadCRUT4 which would be HadSST3 + CRUTEM4 each with more data and better error models well before AR5 which seems sensible ...

Mr. Fraudit never goes away does he? How often has he been told that we don't have permission? Ho hum. Oh, I heard that fraudit's Santer et al comment got rejected. That'll brighten your day at least a teensy bit?

Peter

Phil,

I can't believe that people think it remotely reasonable behaviour to send that sort of crud. They'd never say that to your face. I guess their home is just that much more cosy and impersonal.

Cash would need spending in FY09/10 as I understand it, but someone for six months (assuming they could start this Sept.) could be a route forwards. It would be a good paper for them career-wise.

HadSST3 is in first draft form. I'm not sure what papers you assume will arise. I think we were thinking of developing HadSST3 and CRUTEM4 seperately (but in a joined up way) and publishing as separate papers and then doing a paper that covers combination to HadCRUT4 and perhaps, for example, a d&a sensitivity to error model assumptions.

Date: Tue, 19 May 2009 12:12:55 -0400

thanks much Phil,

that sounds good. So why don't we wait until next round (June '10) on this then. That will give everyone an opportunity to get their ducks in a row. Plus I'll have one more Nature and one more Science paper on my resume by then (more about that soon!). I'll be sure to send you a reminder sometime next may or so!

Thanks for sending that paper. It takes some work to get a paper rejected by IJC. Want to take a bet that some version of this appears in "Energy and Environment"? Of course, any paper that appears there is not taken seriously anyway, its almost a joke.

The contrarians attacks certainly have not abated. The only hope is that they'll increasingly be ignored.

talk to you later,

mike

On May 19, 2009, at 9:03 AM, Phil Jones wrote:

Mike,

Have gotten replies - the're both happy to write supporting letters, but both are too busy to take it on this year. One suggested waiting till next year. Malcolm is supporting one other person this year. I'd be happy to do it next year, so I can pace it over a longer period. Malcom also said that Singer had an AGU Fellowship!!

Apart from my meetings I have skeptics on my back - still, can't seem to get rid of them. Also the new UK climate scenarios are giving govt ministers the jitters as they don't want to appear stupid when they introduce them (late June?).

Talking of skeptics - the attached was rejected by IJC. He put it up on something xarchiv. Easy to see why it was rejected. Parts appear quite well written, but they always go too far. Obviously have no idea how to write a paper.

Cheers

Phil

Mike,

I'll email Ray and Malcolm. I'd be happy to contribute. Away all next week
and another couple of weeks in June.

EGU will be in Vienna again. It is set for May 2-7, 2010.

It will also be Vienna in 2011.

Cheers

Phil

At 22:31 16/05/2009, you wrote:

Hey Phil,

I hope all is well w/ you these days. Been a while since I've actually seen you. Perhaps
can convince you to make it to EGU next year? Looks like it will be in Vienna again. I
rather enjoyed this one, and I think I may go back next year.

On a completely unrelated note, I was wondering if you, perhaps in tandem w/ some of the
other usual suspects, might be interested in returning the favor this year ;)

I've looked over the current list of AGU fellows, and it seems to me that there are
quite a few who have gotten in (e.g. Kurt Cuffey, Amy Clement, and many others) who
aren't as far along as me in their careers, so I think I ought to be a strong candidate.

anyway, I don't want to pressure you in any way, but if you think you'd be willing to
help organize, I would naturally be much obliged. Perhaps you could convince Ray or
Malcolm to take the lead? The deadline looks as if it is again July 1 this year.

looking forward to catching up w/ you sometime soon, probably at some exotic location of
Henry's choosing ;)

mike

Darrell (from AGU Toronto):

Great news from Science!

A quick comment on Amplification and signal to noise issues (comment 1 below). It think you meant that the referee felt that Arctic amplification did not translate to a more robust signal because the noise would be equally amplified. I don't know that we can challenge the "climate noise" but we can make the case that the "proxy noise", that is, the uncertainty in proxy calibration, is, as far as I know, the same in the Arctic as in lower latitudes. Consequently, the larger temperature signal expected in the Arctic can be more reliably detected by our proxies because it is more likely to exceed the sensitivity limits of our proxies. If we assume the "climate noise" is more or less gaussian, then we should be better able to detect the relatively subtle temp changes of the Holocene in the Arctic than elsewhere.

Hi Keith,

Nice to hear from you, and sorry to hear about your mother.

Contrary to what I heard a few days ago, I received yesterday the invitation to the Scoping meeting in July and look forward to be joining Peck in providing the paleo-input to the scoping of the report. On the issue of a separate chapter I agree that this option is most practical, yet I don't think there is solid support for that avenue, and fear that it will not be pursued. This means that there is a danger that single paleo-persons distributed into the chapters might become marginalised, and would need some x-chapter support at a time to deal with the issues, and also to provide enough breadth of knowledge about paleo-literature to be assessed. The Plan B option would require that there is a mechanism that pulls together the combined paleo-competence amongst the LAs during the writing of AR5. I think there will be a strong emphasis in AR5 on regional changes, and on climate predictions. Predictions need a strong basis in knowledge about natural modes of variability and the interplay between natural and man made changes on the regional scale, areas where the paleo perspectives are clearly needed and contribute. I think many new results are emerging, and we need to be on top of this to make the case in Venice.

It would be great if you could, within the next week preferably, send us a list of what new results you think will be good to use for the scoping.

Cheers
Eystein

Hi Darrell et al - got a chance to read the paper and comments enroute
to Atlanta. Here's
some feedback..

General - comments are modest and should be easy to accommodate. That
said, I think we have
to take the comments of Rev 2 seriously. I'm guessing that its Francis
Zwiers and in any
case, he knows what he's talking about regarding stats.

Also - IMPORTANT - I'd make sure we check and recheck every single
calculation and dataset.

This paper is going to get the attention of the skeptics and they are
going to get all the

data and work hard to show were we messed up. We don't want this -
especially you, since it
could take way more of your time than you'd like, and it'll look bad.
VERY much worth the
effort in advance.

Ok Rev 1 - wow - never had it so good.

Rev 2

General comment - we should take this one seriously. Get Caspar and
Bette's help. The new

synthesis could be telling us (especially when the outlier in Fig 4B
is discounted - see

below) that the Arctic is, in reality, more sensitive to changes in
radiative forcing than

reflected in the model. Are there other experiments or reasons to
think this is true? If

so, let's make this point and back it up with these other pieces of
evidence. For example,

does the CCSM get Arctic warming from the earl/mid Holocene to present
correctly? Does the

model underestimate the Arctic change obs over the last 100 years.
Since the reviewer

raised this, you could add some refs and prose if needed to respond.
Not a lot, but some.

And, we need to respond one way or the other.

Specific comments

1. agree, in the abstract, I suggest changing the sentence to read
"This trend likely

reflects a steady orbitally-driven reduction in summer insolation,
as confirmed by a

1000-year transient climate simulation." Note that this removes
more than enough words

to meet the

eds requirement too.

2. for this one, I'd simply state that the forcing is stronger in the Arctic than at lower

lats (double check how much) and also add what Giff suggested.

3. agree, make the suggested clarification

4. important (!) and hopefully easy. I leave to whomever did the calculation to make sure

any serial correlation bias was taken into account. Make sure all p values are thus

corrected.

5. ditto, makes sense too

6. clarify

7. this reviewer knows what he/she is talking about - do what they suggest, and double check it's done well.

8. Don't delete the para. Instead point out that you've strengthened it and that it is

important to place the new synthesis in a longer term Holocene context. It also clarifies

to interdisciplinary readers why the Arctic is so sensitive (perhaps more sensitive than in

models? - see above). That said, I would cite Kerwin et al 99 - I've attached it. It

provides added detail and balance. Also, since you're responding to a reviewer comment and

strengthening the ms, you can add the ref w/o hassle (or so I'm guessing on recent experience).

9. yep, delete all "attribution"s in the ms. On p 6, lone 129, can say "...support the

connection between the Arctic summer cooling trend and a orbitally-driven reduction..."

10) reviewer is correct - see my response above for the general comment, and see if you can

work with his/her ideas to improve. The outlier has to be just that?! Need an explanation

before you can remove from any analysis, however.

11) makes sense - do it

12) yep - change text as suggested

13) agree, change p 7, line 153 to read "...1980s appears to have been the single..."

14) agree, change line 167 on p 8 to read "...trend. Our new synthesis suggests that the

most recent 10-year..."

Other suggested changes....

P. 3 line 69 - change region to read regional

P 6 line 128 - "(-2600 to -1600AD) isn't going to make sense to readers. Please provide

some context - SOM or ??

P 7 line 145 - insert "Arctic" before "summer"

P. 11 line 234 change to read "...century. Ten-year means (bold lines) were used..."

Because you don't really say what the bold and unbold lines are - this will help the reader

make sure they have it right.

Fig 4 and caption - need to explain why the isolation axes are labeled differently - the

numbers, and that both are still cover the same number of Wm-2.

Didn't look at SOM, but make sure it's all bomber too, since there is a good chance it will

get PICKED apart, and any errors thrown back in our face in a counter productive manner.

Thanks! Nice job. Best, Peck (probably w/o email for a while in the Amazon, although one never knows...)

On 5/26/09 1:08 PM, "Darrell Kaufman" <[1]Darrell.Kaufman@nau.edu> wrote:

Co-authors:

I just received the reviewers' comments and editor's decision on our SCIENCE manuscript

(attached). The decision isn't final, but it looks like good news, with very reasonable

revisions. Reviewer #1 had nothing substantial to suggest. Reviewer #2 was rather

thorough. I think I can address his/her suggestions but could use some help with three:

(1) The reviewer challenged our assertion that, because climate change is amplified in

the Arctic, the signal:noise ratio should be higher too. We don't have more than 1

sentence to expand on the assertion in the text. We could plead the case to editor and

hope that it doesn't trip up the final acceptance, or we could omit it from the text.

Suggestions?

(2) The reviewer suggested that, if we are concerned about outliers influencing the mean

values of the composite record, we should attempt a so-called "robust" regression

procedure, such as median absolute deviation regression. Does anyone have experience

with this?

(3) The reviewer was concerned that we overestimated the strength of the relation

between temperature and insolation in the long CCSM simulation.

Namely s/he criticized

the leveraging effect of the one outlier in the model-generated insolation vs

temperature plot (Fig. 4b), and suggested that we use 10-year means instead of 50 year.

Dave: you up for this, please?

Please forward any input to me and I'll compile them, and let you all have a look before

I submit the final revisions. I'm hoping we can turn this around this week.

Thanks.

Darrell

Dear Dr. Kaufman:

Thank you for sending us your manuscript "Recent Warming Reverses Long-Term Arctic Cooling." We are interested in publishing the paper as a Report, but we cannot accept it in its present form. Please revise your manuscript in accord with the referees' comments (pasted below) and as indicated on the attached editorial checklist and marked manuscript. I have also made some suggestions regarding shortening and clarification directly on the manuscript. Because of the nature of the reviewers' comments and revisions required, we may send the revised manuscript back for further review.

Please return your revised manuscript with a cover letter describing your response to the referees' comments. We prefer to receive your revision electronically via our WWW site ([4]<http://www.submit2science.org/revisionupload/>) using the User information above. In your letter, please also include your travel schedule for the next several weeks so we can contact you if necessary. The revised manuscript must reach us within four weeks if we are to preserve your original submission date; if you cannot meet this deadline, please let us know as soon as possible when we can expect the revision.

The cost of color illustrations is \$650 for the first color figure and \$450 for each

additional color figure. In addition there is a comparable charge for use of color in reprints. We ask that you submit your payment with your reprint order, which you will receive with your galley proofs. We also now provide a free electronic reprint service; information will be sent by email immediately after your paper is published in Science Online.

Science allows authors to retain copyright of their work. You will be asked to grant Science an exclusive license to publish your paper when you return your manuscript via our revision WWW site. We must have your acceptance of this publication agreement in order to accept your paper. Additional information regarding the publication license is available in the instructions for authors on our www site.

I look forward to receiving your revised manuscript. Please let me know if I can be of assistance.

Please let me know that you have received this email and can read the attached files.

Sincerely,

Jesse Smith, Ph.D.

I don't think we should go there. Any PC analysis on proxy data will be picked apart by the skeptics, even if it yields some useful insight, and I don't recall there being anything too exciting in the pattern given the limited amount of data.

Dave

On Wed, Jun 3, 2009 at 5:42 PM, Darrell Kaufman
<[1]Darrell.Kaufman@nau.edu> wrote:

Dave and Nick:

I've been thinking about the remaining holes in the manuscript. Spatial patterns are important. At one point we explored the spatial pattern of the PC scores. I think it would be good to bring this up in the SOM. I could make a dot map showing the site locations and their correlations with PC1. The upshot would be that the proxy types are not uniformly distributed, and there are too few records to discern any spatial patterns from any geographical or proxy-type bias (e.g., high-elevation ice cores).
Thoughts?
Darrell

Adrian,

Emails to Kate yesterday were returned by the ECMWF server (for your email address) but not for Dick's?

I also found the two emails you sent last night in my spam list. No idea why this is happening. I found some other semi-important emails in my spam as well!

Anyway - hope you get this email!

All three reviewers are positive, which is good, but there is still a lot of to do as you say.

Here are some initial thoughts. Before I begin - it seems as though Rev 2 comments have ended abruptly during #13. I'd suggest you ask if there is any more?

Rev 1

I would have thought that the second point (larger trends in full ERA-INTERIM fields) was just an interesting aside, and not as important as the RH decline.

I'll need to go back to see if sections 5 and 6 can be reordered/restructured?

Both Reviewers 1 and 2 (they appear to be Kevin and Aiguo, but odd to have two people who only live a few rooms apart!) make quite a few statements about GPCC. We're doing updating work on the higher resolution CRU-TS (0.5 by 0.5 degree lat/long) datasets. We're doing comparisons with GPCC and for the Giorgi type regions (as in Fig 3.14 of Ch 3 of AR4) and the agreement is amazingly good. Maybe all you need to point to is this Figure and the previous one (Fig 3.12) to say that for land regions at the continental scale, it doesn't matter which datasets are used (for the period

from the 1970s). The key thing is that they just use gauges, with no satellites.

My view is that bringing in satellites as in CMAP and GPCP products can lead to problems, and some circularity with ERA results - as you'll be using some of the same satellite data products. The point to emphasize for precip is that GPCC is totally independent from any ERA (40 or Interim) input.

I've come across these issues about GPCC before. I've been haranguing Bruno Rudolf and now Tobias Fuchs of GPCC to write something up for a number of years within AOPC! I think their QC is likely the best of all the centres, but they will continue to get these

doubts if they don't write anything up. They should at least explain how they do their interpolation - it can certainly be done better.

GPCC is using so much more data that it has to be better than any other product.

They can't release the raw station data, and it seems they can't release the numbers in each grid box.

There will be an HC paper on the buoy/ship SST issue, but this isn't yet used operationally.

It will come, but not before your paper goes back.

I hope it is fairly straightforward to do RMSs as well as correlations. We had SDs in the 2004 paper. I don't think RMSs would show anything untoward, but would take up some

more space.

WRT Rev 2, I'm not that convinced by some of Aiguo's arguments. Between us, I'm not that convinced by some of his data analyses. The ones involving PDSI leave a lot to be desired (this is coming to light in other work we are doing).

Rev 2 #6 Obviously not read the paper(s). CRUTEM3 is a simple average of stations within a grid box. There is no interpolation! If there are no stations, then there is no value!

I think this is the same for HadCRUH as well.

Rev 2 #13 Comment seems to end abruptly. I'd like to know what I might have said! I don't think I've ever said I doubt GPCP!

I am around all the time except for the week of July 12-17, when I'll be at the IPCC Scoping meeting in Venice. Kevin will be there as well.

Aiguo will be in CRU the first few days of the week after (July 20/21)

Cheers

Phil

It's a bit irritating getting a review one wants to nail just before leaving for Brussels for three days of EC-related meetings.

I'm sure now that reviewer 2's comments on SYNOP numbers is easily answered. The number of GTS SYNOPs went up a lot, but that's not because there were a lot more stations installed - the existing one just started having their data transmitted more frequently than 6-hourly. But this should hardly have effected the RH2m analysis as it uses only the 0, 6, 12 and 18UTC obs that have been there pretty well all the time. It only uses off-time obs if the value for the main synoptic hour is missing. The 4D-Var does assimilate more data over time, but here we appeal to fig 8 and argue that the increment does not shift over time. We already argue in the Appendix that the extra obs over North America may well be part of the difficulty HadCRUHext has for that region.

Anyway I'd like to confirm that the number of used SYNOPs does not change much over time for the OI RH2m analysis. I know how to find the number in the job output, but I don't know how to retrieve the job output from the logfiles stored in ECFS. I would only look at a few samples. I'd be grateful if you'd let me know how to do this.

In any case even if there was a problem with the numbers increasing sharply around 2000, this would manifest itself in a sudden drop in the RH time series, not a steady decline over the last few years.

After a bit of thinking I can find several things wrong with reviewer 2's argument why q over land is insensitive to variations in q over sea (think coastal mountain ranges, deserts, drought regions - moisture does not simply build up everywhere over land via onshore winds from the boundary-layer until it rains), and the response can draw attention to other points made in the paper, such as the coherence of changes in the vertical, and the similarity (but lag) of the q series over land and sea. Hard to believe the latter is all coincidence.

Also, there is a relationship between q and precip, not generally strong, but there's a high correlation for Australia.

Better stop for now.

Adrian

Manuscript Title: Low-frequency variations in surface atmospheric humidity, temperature and precipitation: Inferences from reanalyses and monthly gridded observational datasets

Dear Dr. Simmons:

Attached below please find 3 reviews on your above-referenced paper. One of the Reviewers has raised questions and made suggestions for important revisions, mostly involving organization and presentation. Please consider the Reviewer reports carefully, make the necessary changes in your manuscript and respond to me, explaining how you have addressed these comments. In your Response to Reviewer letter, please include a statement confirming that all authors listed on the manuscript concur with submission in its revised form.

The due date for your revised paper is July 20, 2009. If you will be unable to submit a revised manuscript by July 20, 2009, please notify my office and arrange for an extension (maximum two weeks). If we do not hear from you by the revision due date, your manuscript will be considered as withdrawn.

When you are ready to submit your revision, please use the link below.

*The link below will begin the resubmission of your manuscript, please Do Not click on the link until you are ready to upload your revised files. Any partial submission that sits for 3 days without files will be deleted.

<[1]<http://jgr-atmospheres-submit.agu.org/cgi-bin/main.plex?el=A5Bc4EasP6A2oLJ3I6A9jNWgLzbgfWly58nFGPxNeQZ>>

(NOTE: The link above automatically submits your login name and password. If you wish to share this link with co-authors or colleagues, please be aware that they will have access to your entire account for this journal.)

**In order to save time upon acceptance, it would be helpful if files in the correct format are uploaded at revision. Article and table files may be in Word, WordPerfect or LaTeX and figure files should be separately uploaded as .eps, .tif or pdf files. If you have color figures, please go to the site below to select a color option. Please put your color option in the cover letter.

Reviewer #2 (Comments):

Review of JGR Manuscript entitled

Low-frequency variations in surface atmospheric humidity, temperature and precipitation: inferences from reanalyses and monthly gridded observational data sets

by A.J. Simmons, K.M. Willett, P.D. Jones, P.W. Thorne, and D. Dee

General comments:

This paper provides a nice and useful summary on how the ERA-40 and ERA-Interim surface analysis products of temperature and humidity were derived, and a fairly comprehensive evaluation/comparison with the HadCRU surface data sets derived purely from surface observations, as well as with three other precipitation products. They found that in general the ERA surface temperature and humidity data from 1973 onward are in close agreement with the HadCRU data sets and that ERA precipitation also follows closely with gauge-based products, although long-term changes differ. Furthermore, the study reports a significant and steady decline in surface relative humidity (RH) over land from ~1999-2008 and suggested that the recent steady SSTs might be responsible for this land RH decrease. The manuscript is well written, the analysis appears to be comprehensive, and the results are of interest to many readers in the climate community. I think the paper should be published after some relat

ively

minor revisions.

My main concern is the interpretation of the recent RH decline over land. To me, the RH decreases shown in Fig. 4 and Fig. 7 look a bit spurious (non-climatic, e.g., lack of variations in Fig. 4 and stepwise changes in Fig.7) rather than realistic changes. They are also inconsistent with the RH changes during recent decades (up to 2004) reported in Dai (2006, JC), and this is not pointed out in the paper. As shown in Dai (2006), there was a 3-fold increase around the late 1990s in the number of surface humidity reports (mostly in North America but also over some other regions) included in the WMO SYNOP GTS reports. Furthermore, I personally found that there were other (undocumented) changes in the SYNOP reports around that time that led to shifts in derived precipitation and cloud frequencies over Euroasia and other places. Thus, there are reasons to suspect some non-climatic changes in the SYNOP reports around the late 1990s that might alter the RH trend over land.

I also was not convinced by the physical explanation of the RH decline (p.23). Even if the surface q stayed the same over the oceans during the 1999-2008 period when land air temperature has been increasing, this can not explain the RH decrease over land. This is because as long as the marine air contains more water vapor than continental surface air (which is still true even if marine sfc. q did not increase), advection of marine air onto land should cause land q to accumulate and RH to increase until the land q and RH reach certain levels so that precipitation kicks in to remove the moisture over land.

Remember that the atmospheric moisture storage (PW) is very small compared with the annual P and E fluxes, thus any perturbation in RH is quickly (within days) restored through surface E , vertical mixing, or lateral advection/mixing. If the RH in the marine air had decreased, then land RH would likely to decrease too. Dai (2006) did not show RH decreases over oceans since the

1980s. I wish the authors of this paper would also show RH series over ocean, at least since the middle 1980s.

For the ERA humidity data, the large well-known inhomogeneities in radiosonde humidity records will certainly propagate into the ERA background forecast and its analysis fields, making them not really suitable for long-term trend analyses. For example, all U.S.-operated radiosonde records (including many in the Pacific) before about Oct. 1993 report a dew point depression (DPD) of 30deg.C or a RH of 20% for any cases where RH is below 20%, which resulted in an abnormally higher frequency of reports of DPD=30deg.C and few reports below and no reports above DPD=30deg.C. This practice is also found in some Mexican, Canadian, Australian, and few other places (but stopped at different times from the late 1980s to the 1990s). In general, the newer humidity sensors during the last 10-15 years report more low RH or large DPD cases, whereas earlier ones had no measurements or incorrect values for these cases. One can see this shift in the histograms of daily DPD made by different humidity sensors. Thus, one needs to be very cautious when radiosonde humidity data are used in assessing trends, even if they are used indirectly (as in the ERA surface humidity analysis).

Some other comments:

1. Abstract: it gives the impression that even the long-term mean values for surface T, q and RH are the same between ERA and HadCRU data sets, which appears to be not the case as the respective means are removed in all plots. Please mention that the climatological mean may differ (if this is the case) even though the anomaly variations are similar.

2. Abstract, at the end: Please note that the mean precipitation amount and its change rate are not controlled by atmospheric water vapor amount (q), although higher q is often associated with higher P (e.g., tropical vs. high latitudes). Locally, you can have moist air passing by without any rain. Globally, annual P is controlled by how much moisture gets evaporated from ocean and land surfaces (i.e., $P=E$), and this surface E is primarily controlled by surface energy terms. In essence, P and E are water fluxes, and PW (or q) is the water storage in the atmosphere. People often link P to q because of the associated mentioned above (through low-level moisture convergence in a storm, etc.), and think that P change rates somehow should follow that of q or PW. However, P (or E) and q are controlled by different processes and in general the flux terms are not coupled with the storage terms in a cycling system (e.g., no one would think P or E is controlled by water storage in the ocean).

3. p. 3, top: the net radiative effect of clouds is relatively small, when their effect on solar radiation is included. To include clouds in the natural greenhouse warmth is a bit misleading because the higher surface temperature is maintained primarily by the greenhouse effect of water vapor and CO₂.

4. p. 4, middle: Again, any sampling/reporting biases in WMO SYNOP reports could affect both ERA and HadCRUH humidity data. Thus caution is still needed.

5. pp.5-6, section 2a: So in essence, ERA-40 and ERA-Interim surface T, q, and RH are another analysis product based on surface observations, just like the HadCRU and other climate data sets. The only difference is in the analysis methodology (IO interpolation with the use of the ERA background forecast fields vs. other more conventional analysis methods). Like most users, I thought the ERA surface fields are more tightly coupled with the reanalysis model system. I think it would be helpful to point out the above at the beginning of this section or in the Introduction.

6. p. 7, top: Please briefly mention how the station anomalies were aggregated onto 5deg. grid in CRUTEMP3, e.g., by simply averaging station values within the grid box, or

making use of correlated, nearby station data outside the box when sampling inside the box is sparse? I think most people would use the later to increase the coverage in the gridded products.

7. p. 7, bottom: Have any adjustments/corrections done for the most recent decades (1999-2008) in HadCRUH+ext? This is the period when RH decreases. Are there any homogeneity issues in combining the extended records with the homogenized HadCRUH?

8. p. 9, top: How could the fit of the ERA background forecasts capture multiple shifts induced by instrumental changes or reporting practices, especially when the future changes are needed to determine the timing and the size of a shift. Many statistical methods specifically designed to do these two tasks by analyzing the whole historical series still have difficulties in reliably detecting the locations of shifts and can only make a best guess regarding the real shift size. I wonder how one can do this in a reanalysis system when future records are not used yet, or nearby station series are combined together to form a grid box series that contain shifts from multiple stations (i.e., the stepwise patterns become very complex and look more like real variations).

9. p. 9, middle: I can't believe the GPCC people are still gridding precipitation total, not anomalies. This makes their products useless for long-term change analyses. Another land precipitation product from 1948-present that is derived from gauge records and the OI method is the PRECL from the NCEP Climate Prediction Center (CPC, ref: Chen et al. 2002, J. Hydrometeorol.). I think that is a better products for assessing long-term changes in land precipitation, although the gauge coverage for recent years (after 1997) may be not as good as that of the GPCC.

10. p. 11, middle and bottom: need to point out in Abstract or Summary that differences in the mean exist between the ERA and HadCRU T and humidity data.

11. Fig. 1 and other Figures: I suspect that different mean values were removed in computing the difference series. If that's the case, then need to point out this (i.e., the difference is between the anomalies relative to their respective mean).

12. Fig. 4: also show RH over the oceans for the last 25 years?

13. Fig. 11: with the changing gauge coverage and gridding precipitation total, one can not trust the low-frequency variations in the GPCC products. Phil Jones and other have
Reviewer #3 (Comments):

Review of the paper entitled "Low-frequency variations in surface atmospheric humidity, temperature and precipitation: Inferences from reanalyses and monthly gridded observational dataset" by A.J. Simmons, K. M. Willett, P. D. Thorne and D. Dee.

Recommendation: Accept with minor changes.

Summary of the paper:

This is an elaborate study examining trends in temperature, humidity and precipitation from the latest ECMWF reanalysis, comparing with independent gridded analyses, which are also performed with utmost care. The paper revealed that the commonly accepted assumption that the relative humidity stays the same under global warming condition does not necessarily holds over land. This is an important finding and should be of interest to wide climate communities. There are several other important contributions, such as the sensitivity of observation coverage on long term trend, which can only be studied by the use of reanalysis that has full global coverage. This paper also presents that the ERA-40 and ERA-Interim are of very high quality and useable for low frequency climate studies.

Major comments:

1. I am particularly impressed with the way the work is performed. This is a very elaborate work using a variety of datasets to present that there is a strong long time trend in temperature and humidity. This thorough work made it possible to convince readers these observed facts. Although the finding of the decrease in relative humidity

over land is credible, it may be more meteorologically interesting and convincing if additional analysis is made to present the possible mechanisms of the absence of increase in specific humidity over land. If reanalysis is used, it is not impossible to estimate the change in the moisture transport into land areas (although this may involve considerable amount of work). It may also possible to examine the change in large scale mean land-ocean circulation that contributes to the transport of moisture. From heuristic point of view, stronger heating over land tends to strengthen upper level high and subsidence, which may prevent moisture to be transported inland, and such trend may be detectable from large scale reanalysis. In terms of the change in precipitation, moisture availability and relative humidity are important, but static stability and large scale convergence should also play an important role. If any of these additional analyses can be performed, or even discussed in qualitative manner, it will enhance the paper.

2. It is not very clear how the diurnal variations of temperature and humidity are handled in this study. It is helpful to state the time frequency of reanalysis output that is used to compute daily mean, and the way observed daily mean are obtained.

3. Are there any reason that the relative humidity or dew point depression is analyzed and not the specific humidity itself?

4. The paper is a little too long. One way to shorten it is to separating it into two parts by adding analysis suggested above, or separating the analysis of precipitation. This is just a suggestion and decision is up to the authors.

Minor comments:

1. Page 6 & 11. The authors claim that the use of anomaly will reduce the influence of surface elevation differences. Can this be true even the relation between elevation and relative humidity/specific humidity is very nonlinear?

2. It may be friendlier to the reader why relative humidity and specific humidity are both examined. Some introductory remarks on the different impact of relative and specific humidity will help.

3. Page 13. Lines 298-300. These lines just present why the ERA-40 and Interim are different but not the reason for the ERA-Interim worse than ERA-40 over Africa.

4. Page 14. Lines 316-328. Is it possible to separate the actual reduction in the number of observations and the reduction in data used by CRUTEM?

5. Page 15. Line 364. It seems that the difference in analysis between ERA-40 and ERA-Interim seems to be used as a measure of the reanalysis accuracy. Is this a good assumption?

6. Page 17. Lines 392-397. Can it be possible to mathematically estimate the relation between the correlation of specific humidity and relative humidity? Since relative humidity is a function of specific humidity, temperature and pressure, it seems natural that the correlation for relative humidity should be lower. However, this will depend on which parameters are analyzed in the first place.

Subject: Re: Fwd: CRU surface temperature dataset
Date: Thu, 25 Jun 2009 10:59:26 +0100

Phil

Thanks for this great detail. I am thinking that probably a raw radiosonde dataset may be better (I tried this before using the LKS dataset but station density was an issue and only ended up with around 20 station pairs) - it sounds as though things have improved dramatically in that area and will look at the sources you suggest. My hope is that at least I can find hundreds/thousands of stations near to my high elevation surface ones for comparison. If not I could interpolate spatially maybe between radiosondes to my surface sites since free-air climate (not meteorology) should be relatively smooth in space. I cannot interpolate between surface stations.

I agree that reanalyses can be a can of worms (esp NCEP/NCAR)!

As for the surface I'll also look at the site you suggest and get back if I have any Q/problems. I appreciate the time you have taken to answer some of my Q!

Best wishes

Nick

>>> Phil Jones <p.jones@uea.ac.uk> 24/06/2009 13:09 >>>

Nick,

I don't want to put off, but there is an awful lot of things wrong with NCEP/NCAR.

They are probably OK for month-to-month variability, but if you look at some

of the figures in Simmons et al (2004) you'll see that for trends they are practically useless before 1979.

There is just so much wrong with the sondes which together with the introduction of satellite data in 1978/9 makes reanalyses awful.

The Simmons paper is about how much better ERA-40 is than NCEP/NCAR.

It is also telling you that you shouldn't be using NCEP/NCAR for trends - and ERA-40

is only OK in Europe and North America.

A group of us are hopeful of getting an EU project funded to go through the

Reanalysis input - surface and sonde. The aim is to put in all the homogenised

surface and sonde data, so giving reanalysis better data input - and putting back all the

data that missed the real-time cut. I'm not sure you're aware that no back data have

ever got into the reanalyses. If data doesn't make the cut in real time, it can never get

in later. The reanalysis source input doesn't collect back data!

You'd be better off getting one of the newer sonde datasets.
HadAT2 although developed
in 2005 is beyond it's sell-by date. Have a look at the attached
and this web site

<http://homepage.univie.ac.at/leopold.haimberger/leoweb/index.html>

Ra-ob core version 1.4 is the latest.

The drop off in surface data isn't the fault of GHCNv2. The
folks in Asheville are doing all
they can to get additional datasets. Currently about 2000 sites are
exchanged in real time.

If the sites you want are not exchanged by Met Services in real
time we can't get access
to them except by asking each Met Service and/or waiting till the
next volumes of the 10-year
books (for 2001-2010) get released.

CRUTEM3 has some additional station data going in for Australia
and Canada, but apart
from this we will have nothing more than GHCNv2. We could get a
load more from the US
quite easily, but coverage is reasonable there compared to the rest
of the world.

GHCNv2 and ourselves have lots of historic series, but these
aren't updatable in real
time, without continuous effort. Lots of projects were funded in
the US and Europe in the
1980s and 1990s to get loads of data digitized, homogenized and
accessible.

It is possible to do things with daily data (SYNOPS) but these are
only generally good enough for the good countries.

http://www.dwd.de/bvbw/appmanager/bvbw/dwdwwwDesktop/?_nfpb=true&switchLanguage=en&_pageLabel=_dwdwww_klima_umwelt_datenzentren_gsnmc

This site has what is available in real time - since 2001. This
site can be very annoying.
There is a link back to NCDC.

Cheers
Phil

Hi Phil,

well put, it is a parallel universe. irony is as you note, often the contrarian arguments are such a scientific straw man, that an effort to address them isn't even worthy of the peer-reviewed literature!

mike

On Jun 25, 2009, at 10:58 AM, Phil Jones wrote:

Mike,

Just spent 5 minutes looking at Watts up. Couldn't bear it any longer - had to stop!. Is there really such a parallel universe out there? I could understand all of the words some commenters wrote - but not in the context they used them.

It is a mixed blessing. I encouraged Tom Peterson to do the analysis with the limited number of USHCN stations. Still hoping they will write it up for a full journal article.

Problem might be though - they get a decent reviewer who will say there is nothing new in the paper, and they'd be right!

Gavin,

Good to see you, if briefly, at NCAR on Friday. The day went well, as did the dinner in the evening.

It must be my week on Climate Audit! Been looking a bit and Mc said he has no interest in developing an alternative global T series. He'd also said earlier

it would be easy to do. I'm 100% confident he knows how robust the land component is.

I also came across this on another thread. He obviously likes doing these sorts of things, as opposed to real science. They are going to have a real go at procedures when it comes to the AR5. They have lost on the science, now they are going for the process.

Cheers

Subject: Re: IPCC Fig. 6.10
Date: Wed Jul 1 10:31:36 2009

Hi Juerg,
At 21:56 16/06/2009, you wrote:

I hope you are very well. Douglas arrived savely here and hopefully he will be starting officially soon. I am looking very much forward having him here and of course working together with you on different topics!

Yes, that sounds great to me too.

I have a chinese paleo climatology researcher (Zhinxin Hao) with me for a couple of weeks.

She is working on the comparison with different chinese long temperature reconstructions and would like to present a similar figure as in the IPCC Fig 6.10.

Keith told me that he might not be able to work for the next time, so I thought I could address this issue to you as you were also much involved.

That's fine. Indeed I designed and drew the figure.

She asked me if I could ask you whether you could have a look at the attachment where she tried to explain how she calculated and plotted the curves for China. As she did not fully understand the way it was done in the IPCC report, would you mind having a look at the text and let me know if she applied it correctly?

It is a little hard to follow (some symbols got replaced by squares -- perhaps a PDF file would work better than a Word Doc?) but I think that the method looks approximately right but not quite right. Some things that look a bit different:

Se: it appears that the same value is used for all 4 reconstructions (in the example, Se=1.3165 is used). Why would the uncertainty on one reconstruction be the same as the uncertainty on all the others? Perhaps she has used the standard deviation of the instrumental temperature rather than the standard error of each reconstruction? Did the authors actually publish estimated uncertainties along with their best-estimate reconstruction series? You should also note that reconstruction errors/uncertainties may depend on time scale -- the IPCC fig 6.10 showed variations on timescales of 30-yrs and

longer, so I attempted to use uncertainties estimated for that timescale (or a similar multi-decadal timescale).

IPCC wanted to mostly standardise on the 90% range (5%-95%), so for my scoring I awarded $100\%/N$ to any temperature that falls within the ± 1 SE reconstruction range (the same as noted in her document) but awarded $0.5*100\%/N$ to any temperature that falls within ± 1.6448 SE reconstruction range (this differs from the ± 2 SE in her document). I originally used ± 2 SE, but (under assumption of normality), ± 1.6448 SE should encompass 5%-95% range, while ± 2 SE is of course approx 2.5%-97.5%. Either is of course equally defensible, but if you want to reproduce IPCC, then its ± 1.6448 SE for the half score ($0.5*100\%/N$).

This is of course repeated for all N reconstructions.

I was a little unsure about the actual plot produced too. When the Xu2003 curve is very low or very high, the brown shading extends in both directions (to very low *and* very high values at once). e.g. AD 650 (but there are others too). Also the range is very narrow at about AD 1050; although the 3 recons are quite similar here, it still looks too narrow, especially when you add on the reconstruction SE (and ± 1.6448 SE or ± 2 SE).

Hope this helps,

Tim

Dear Zhixin,

At 15:14 01/07/2009, you wrote:

Do you mean Se should be the standard error from the individual reconstruction series
yes, that's what I mean.

(before I got your answer, I calculated the standard error for the 5 reconstruction data at one time point, e.g. 1470s, it is not from the original papers given by the authors)?

Ah. I understand what you've done now.

But my question is if the author did not publish the uncertainty, how can I deal with the value of Se?

Well, the original purpose of constructing IPCC Fig. 6.10c was to display the published uncertainty estimates of each study. If no uncertainties had been estimated by the original authors then we wouldn't have produced the figure in the first place!

So, do you really want to produce such a figure to show the uncertainty ranges when the uncertainty ranges haven't been calculated before?

If you do, then you'd need to somehow estimate the uncertainty. You could do this yourself, perhaps, e.g. from the differences between each reconstruction and the instrumental temperatures during some overlap (calibration, or independent verification) period? But this wouldn't measure any increase in uncertainty during periods when each reconstruction is perhaps based on less input proxy data.

Estimating the uncertainty from the spread of individual reconstruction values in a particular year, like you've done, is open to criticism. Do you really think that in a particular year when the three recons have very similar values that the uncertainty is much less than other nearby years? If you had a high number of

And now I understood the meaning of 5%-95% range, I will follow this, and replot my figures with $\pm 1.645SE$ for the half scores.

Thank you very much again, hopefully I can give the uncertainty of reconstruction results over China region soon. After finished, may I send the manuscript to you and give us comments and suggestions?

Best wishes,

Zhixin

Subject: cruts tmp to 2008
Date: Fri, 10 Jul 2009 00:19:58 +0100 (BST)
Reply-to: t.osborn@uea.ac.uk
Cc: "tim Osborn" <t.osborn@uea.ac.uk>

Hi Harry,

finally had time to take a look at the latest cruts3 run through to 2008 for tmp, picked up from /cru/cruts/

Two PDFs showing seasonal national means are attached.

Look at ...2008a_vs_2008b.pdf first. Black is your previous update to 2008, pink is the latest one. Many very similar, some small differences (presumably due to outlier 3/4 SD removal... note that as these are national/seasonal means, outliers might be quite large, yet only show up small in the means if many other stations contribute).

page 4. The hot spike in Guatemala SON has been removed in the new version. That looks much better.

page 6 & page 9: the hot spikes in France, Italy and Austria in JJA in 2003 have been reduce slightly too. Not sure if this is right or not, could ask Phil what he thinks. Could Jul & Aug 2003 have been so hot that some observations validly did exceed the +3SD outlier check? Or do you use a +4SD check for TMP? Anyway, this is one to ask Phil about.

There are various other erroneous hot spikes that have now been correctly removed, I won't list them all here.

However, there are some cold spikes in both previous and latest 2008 updates... see e.g. Mali SON on page 12. Have you turned on only outlier checking for +3SD, and not for -3SD? Some wrong-looking cold spikes are still present.

Now look at ...2005_vs_2008b.pdf. Black is last years CRUTS3 through to 2005 (I know the files went to mid 2006, but I stopped at last complete year). Note this isn't CRUTS2.1! :-). Pink is again the newest version of the update to 2008.

There are some early 20th century differences that I'm not too bothered about, though it would be nice to know why they arise. One concern is that the mean level is different between the versions... see e.g. JJA for various countries on pages 7 and 8. Seems to be a constant offset. It's too big to be a simple rounding error in my calculations (I may have changed from 1 dec. place to 2 dec. place, but some differences are about 0.5 deg C), and these are absolute values so there's no dependency on any anomalisation/reference period meaning as I'm not doing any.

Intriguing. Perhaps some normals have change in some regions/seasons?

So:

- (1) hot spikes have been corrected.
- (2) cold spikes still there.
- (3) some odd differences in mean level.

Progress!

Tim

<jdannan@jamstec.go.jp>, Grant Foster <tamino_9@hotmail.com>

The leads and lags are analyzed in detail in this paper
Trenberth, K. E., J. M. Caron, D. P. Stepaniak, and S. Worley 2002:
[1]The evolution of
ENSO and global atmospheric surface temperatures J. Geophys. Res.,
107, D8,
10.1029/2000JD000298.
and we were not able to reproduce Tom Wigley's result (we tried). It
may depend in indices
used. In this paper we also document the extent to which ENSO
contributes to warming
overall.
Kevin
Phil Jones wrote:

Mike,
See below for instructions.
Also, just because IPCC (2007, Ch 3) didn't point out the 6/7-month
lag
between the SOI and global temperatures doesn't mean it hasn't been
known for years. IPCC is an assessment and not a review of
everything
done. If they had even read Wigley (2001) they would have seen this
lag pointed out. I wasn't the first to do this in 1989 either. I
don't
think Walker was either. I think the first was Hildebrandsson in
the
1890s. Why does it always go back to a Swede!
file is at [2]ftp.cru.uea.ac.uk
login anonymously with emails as pw
then go to people/philjones
and you should find santeretal2001.pdf
Cheers

At 14:08 28/07/2009, Michael Mann wrote:

thanks Phil,
this is very helpful and reaffirms what we've identified as some of
the main points that need to be covered in a formal response. I've
taken the liberty of copying in a couple other colleagues who have
been looking into this. Grant Foster was the first author on a
response to a similarly bad paper by Schwartz that was published
some
time ago, and has been doing a number of analyses aimed at
demonstrating the key problems in McClean et al.

is I've suggested that Grant sent out a draft of the response when it ready to the broader group of people who have been included in these exchanges for feedback and potential co-authorship,
mike

p.s. Santer et al paper still didn't come through in your followup message. Can you post in on ftp where it can be downloaded?

On Jul 28, 2009, at 5:15 AM, Phil Jones wrote:

Jim et al,

Having now read the paper in a moment of peace and quiet, there are a few things

to bear in mind. The authors of the original will have a right of reply, so need to

ensure that they don't have anything to come back on. From doing the attached a

year or so ago, there is a word limit and also it is important to concentrate only

on a few key points. As we all know there is so much wrong with the paper, it

won't be difficult to come up with a few, but it does need to be just two or three.

The three aspects I would emphasize are

1. The first difference type filtering. Para 14 implies that they smooth the series

with a 12 month running mean, then subtract the value in Jan 1980 from that in

Jan 1979, then Feb 1980 from Feb 1979 and so on. As we know this removes

any long-term trend.

The running mean also probably distorts the phase, so this is possibly why

they get different lags from others. Using running means also enhances the

explained variance. Perhaps we should repeat the exercise without the smoothing.

2. Figure 4 and Figure 1 show the unsmoothed GTTA series. These clearly have a

trend. Perhaps show the residual after extracting the ENSO part.

3. They do the same first difference on the smoothed SOI. The SOI doesn't explain

the climate jump in the 1976/77 period. Their arguments in para 30 are all wrong.

A few minor points

- there are some negative R*R values just after equation 3.

- I'm sure Tom Wigley wouldn't have proposed El Nino events occurring after volcanoes!

Attached this paper as well. From a quick read it doesn't say what is purported - in fact

it seems to show clearly how the analysis should have been done.

- there is a paper by Ben Santer (more recent) where he applies the same type

of extraction procedure to models. I'll send this separately as it

is large. In case it

is too large here is the reference.

Santer, B.D., Wigley, T.M.L., Doutriaux, C., Boyle, J.S., Hansen, J.E., Jones, P.D., Meehl, G.A., Roeckner, E., Sengupta, S. and Taylor K.E., 2001: Accounting for the effects of volcanoes and ENSO in comparisons of modeled and observed temperature trends. Journal of Geophysical Research 106, 2803328059.

Finally I've attached a paper I wrote in 1990, where I did something similar to

what they did. I looked at residuals from a Gaussian filter, and I added

the smoothed data back afterwards. I was working at the annual timescale

and I did have many more years.

Cheers

Phil

At 00:19 25/07/2009, Michael Mann wrote:

Hi Jim,

Grant Foster ('Tamino') did a nice job in a previous response (attached) we wrote to a similarly bad article by Schwartz which got a

lot of play in contrarian circles.

since he's already done some of the initial work in debunking this,

I

sent him an email asking hi if we was interested in spearheading a similar effort w/ this one.

let me get back to folks after I've heard back from him, and we can discuss possible strategy for moving this forward,

mike

Kia orana All from the Tropical South Pacific

Yes, Phil, a bit like 'A midsummer night's dream!'. and Gavin Tamino's bang up job is great, And good that you go up with stuff on Real Climate, Mike. As Kevin is preoccupied, for the scientific record we need a rebuttal somewhere pulled together. Who wants to join in on the multiauthored effort?? I am happy to coordinate it. Return to 'winter' this evening after enjoying a balmy south east trades and sunny dry 24 C in the Cook Islands.

Jim

Quoting Michael Mann [3]<mann@meteo.psu.edu>:

folks, we're going to go up w/ something brief on RealClimate later today, mostly just linking to other useful deconstructions of the paper already up on other sites,

mike

On Jul 23, 2009, at 11:01 PM, Jim Salinger wrote:

I am tied up next week, but could frame something up the following week which , I hope would be multi-authored. It would be quite good to have a rebuttal from the same Department at Uni of Auckland (which Glenn McGregor of IJC is director of)!

I haven't had the opportunity to download the text here in the

Cook Islands, so this would give me the opportunity to do that.
Who else wants to join in??

Jim

Quoting Kevin Trenberth [4]<trenbert@ucar.edu>:

I am on vacation today and don't have the time. I have been on travel the past 4 weeks (including AR5 IPCC scoping mtg); the NCAR summer Colloquium is coming up in a week and then I am off to Oz and NZ for 3 weeks (GEWEX/iLeaps, CEOP) and I have an oceanobs'09 plenary paper to do.

Kevin

a formal comment to JGR seems like a worthwhile undertaking here. contrarians will continue to cite the paper regardless of whether or not its been rebutted, but for the purpose of future scientific assessments, its important that this be formally rebutted in the peer-reviewed literature.

mike

On Jul 23, 2009, at 9:05 PM, Jim Salinger wrote:

Hi All

Thanks for the pro-activeness. Is there an opportunity to write a letter to JGR pointing out the junk science in this??....if it is not rebutted, then all sceptics will use this to justify their position.

Jim

Quoting Michael Mann [5]<mann@meteo.psu.edu>:

2nd email

Thanks Kevin, hadn't even noticed that in my terse initial skim of it. yes--that makes things even worse than my initial impression.

this is a truly horrible paper. one wonders who the editor was,

and what he/she was thinking (or drinking),

m

On Jul 23, 2009, at 3:51 PM, Kevin Trenberth wrote:

I just looked briefly at the paper. Their relationships use derivatives

of the series. Well derivatives are equivalent to a high pass

filter,

that is to say it filters out all the low frequency variability and

trends.

If one takes $y = A \sin wt$
and does a differentiation one gets
 $dy = Aw \cos wt$.

So the amplitude goes from A to Aw where w is the frequency
 $= 2\pi/L$

where

L is the period.

So the response to this procedure is to reduce periods of 10
years by a

factor of 5 compared with periods of 2 years, or 20 and 50
years get

reduced by factors of 10 and 25 relative to two year periods.

i.e. Their

procedure is designed to only analyse the interannual
variability

not the

trends.

Kevin

hi Seth, you always seem to catch me at airports. only got a
few

minutes. took a cursory look at the paper, and it has all
the

worry

signs of extremely bad science and scholarship. JGR is a
legitimate

journal, but some extremely bad papers have slipped through
the

cracks

in recent years, and this is another one of them.

first of all, the authors use two deeply flawed datasets
that

understate the warming trends: the Christy and Spencer MSU
data and

uncorrected radiosonde temperature estimates. There were a
series

of

three key papers published in Science a few years ago, by
Mears

et al,

Santer et al, and Sherwood et al.

see Gavin's excellent RealClimate article on this:

[6]<http://www.realclimate.org/index.php/archives/2005/08/et-tu-lt/>

these papers collectively showed that both datasets were
deeply

flawed

and understate actual tropospheric temperature trends. I
find it

absolutely remarkable that this paper could get through a
serious

review w/out referencing any 3 of these critical papers--
papers

whose

findings render that conclusions of the current article completely invalid!

The Christy and Spencer MSU satellite-derived tropospheric temperature estimates contained two errors--a sign error and an algebraic error--that had the net effect of artificially removing the warming trend.

Christy and Spencer continue to produce revised versions of the MSU dataset, but they always seem to show less warming than every other independent assessment, and their estimates are largely disregarded by serious assessments such as that done by the NAS and the IPCC.

So these guys have taken biased estimates of tropospheric temperatures that have artificially too little warming trend, and then shown, quite unremarkably, that El Nino dominates much of what is left (the interannual variability).

the paper has absolutely no implications that I can see at all for the role of natural variability on the observed warming trend of recent decades.

other far more careful analyses (a paper by David Thompson of CSU, Phil Jones, and others published in Nature more than year ago) used proper, widely-accepted surface temperature data to estimate the influence of natural factors (El Nino and volcanos) on the surface temperature record. their analysis was so careful and clever that it detected a post-world war II error in sea surface temperature measurements (that yields artificial cooling during the mid 1940s) that had never before been discovered in the global surface temperature record. needless to say, they removed that error too.

and the correct record, removing influences of ENSO, volcanoes, and

even
this newly detected error, reveal that a robust warming of
global mean
surface temperature over the past century of a little less
than 1C
which has nothing to do w/ volcanic influences or ENSO
influences. the
dominant source of the overall warming, as concluded in
every
legitimate major scientific assessment, is anthropogenic
influences
(human greenhouse gas concentrations w/ some offsetting
cooling
due to
sulphate aerosols).
this later paper provides absolutely nothing to cast that in
doubt. it
uses a flawed set of surface temperature measurements for
which the
trend has been artificially suppressed, to show that whats
left
over
(interannual variability) is due to natural influences. duh!
its a joke! and the aptly named Mark "Morano" has fallen for
it!

On Jul 23, 2009, at 3:51 PM, Kevin Trenberth wrote:

I just looked briefly at the paper. Their relationships use derivatives of the series. Well derivatives are equivalent to a high pass filter, that is to say it filters out all the low frequency variability and trends.

If one takes $y = A \sin wt$ and does a differentiation one gets $dy = Aw \cos wt$.

So the amplitude goes from A to Aw where w is the frequency $= 2\pi/L$

where

L is the period.

So the response to this procedure is to reduce periods of 10 years by a factor of 5 compared with periods of 2 years, or 20 and 50 years get reduced by factors of 10 and 25 relative to two year periods. i.e. Their procedure is designed to only analyse the interannual variability not the trends.
Kevin

hi Seth, you always seem to catch me at airports. only got a few minutes. took a cursory look at the paper, and it has all the worry signs of extremely bad science and scholarship. JGR is a legitimate journal, but some extremely bad papers have slipped through the cracks in recent years, and this is another one of them. first of all, the authors use two deeply flawed datasets that understate the warming trends: the Christy and Spencer MSU data and

uncorrected radiosonde temperature estimates. There were a series of three key papers published in Science a few years ago, by Mears et al, Santer et al, and Sherwood et al. see Gavin's excellent RealClimate article on this: [27]<http://www.realclimate.org/index.php/archives/2005/08/et-tu-lt/> these papers collectively showed that both datasets were deeply flawed and understate actual tropospheric temperature trends. I find it absolutely remarkable that this paper could get through a serious review w/out referencing any 3 of these critical papers-- papers whose findings render that conclusions of the current article completely invalid!

The Christy and Spencer MSU satellite-derived tropospheric temperature estimates contained two errors--a sign error and an algebraic error-- that had the net effect of artificially removing the warming trend. Christy and Spencer continue to produce revised versions of the MSU dataset, but they always seem to show less warming than every other independent assessment, and their estimates are largely disregarded by serious assessments such as that done by the NAS and the IPCC. So these guys have taken biased estimates of tropospheric temperatures that have artificially too little warming trend, and then shown, quite unremarkably, that El Nino dominates much of what is left (the interannual variability). the paper has absolutely no implications that I can see at all for the role of natural variability on the observed warming trend of recent decades. other far more careful analyses (a paper by David Thompson of CSU, Phil Jones, and others published in Nature more than year ago)

used
proper, widely-accepted surface temperature data to
estimate the
influence of natural factors (El Nino and volcanos) on
the surface
temperature record. their analysis was so careful and
clever that
it
detected a post-world war II error in sea surface
temperature
measurements (that yields artificial cooling during the
mid 1940s)
that had never before been discovered in the global surface
temperature record. needless to say, they removed that
error too.
and
the correct record, removing influences of ENSO,
volcanoes, and
even
this newly detected error, reveal that a robust warming of
global mean
surface temperature over the past century of a little
less than 1C
which has nothing to do w/ volcanic influences or ENSO
influences. the
dominant source of the overall warming, as concluded in
every
legitimate major scientific assessment, is anthropogenic
influences
(human greenhouse gas concentrations w/ some offsetting
cooling
due to
sulphate aerosols).
this later paper provides absolutely nothing to cast that in
doubt. it
uses a flawed set of surface temperature measurements for
which the
trend has been artificially suppressed, to show that whats
left
over
(interannual variability) is due to natural influences. duh!
its a joke! and the aptly named Mark "Morano" has fallen
for it!

thanks Phil,
this is very helpful and reaffirms what we've identified as some of
the main points that
need to be covered in a formal response. I've taken the liberty of
copying in a couple
other colleagues who have been looking into this. Grant Foster was
the first author on a
response to a similarly bad paper by Schwartz that was published
some time ago, and has
been doing a number of analyses aimed at demonstrating the key
problems in McClean et
al.

I've suggested that Grant sent out a draft of the response when it
is ready to the
broader group of people who have been included in these exchanges
for feedback and
potential co-authorship,
mike

p.s. Santer et al paper still didn't come through in your followup
message. Can you post
in on ftp where it can be downloaded?

On Jul 28, 2009, at 5:15 AM, Phil Jones wrote:

Jim et al,
Having now read the paper in a moment of peace and quiet, there
are a few things

to bear in mind. The authors of the original will have a right of reply, so need to

ensure that they don't have anything to come back on. From doing the attached a

year or so ago, there is a word limit and also it is important to concentrate only

on a few key points. As we all know there is so much wrong with the paper, it

won't be difficult to come up with a few, but it does need to be just two or three.

The three aspects I would emphasize are

1. The first difference type filtering. Para 14 implies that they smooth the series

with a 12 month running mean, then subtract the value in Jan 1980 from that in

Jan 1979, then Feb 1980 from Feb 1979 and so on. As we know this removes

any long-term trend.

The running mean also probably distorts the phase, so this is possibly why

they get different lags from others. Using running means also enhances the

explained variance. Perhaps we should repeat the exercise without the smoothing.

2. Figure 4 and Figure 1 show the unsmoothed GTTA series. These clearly have a

trend. Perhaps show the residual after extracting the ENSO part.

3. They do the same first difference on the smoothed SOI. The SOI doesn't explain

the climate jump in the 1976/77 period. Their arguments in para 30 are all wrong.

A few minor points

- there are some negative R*R values just after equation 3.

- I'm sure Tom Wigley wouldn't have proposed El Nino events occurring after

volcanoes!

Attached this paper as well. From a quick read it doesn't say what is purported -

in fact

it seems to show clearly how the analysis should have been done.

- there is a paper by Ben Santer (more recent) where he applies the same type

of extraction procedure to models. I'll send this separately as it is large. In case it

is too large here is the reference.

Santer, B.D., Wigley, T.M.L., Doutriaux, C., Boyle, J.S., Hansen, J.E., Jones, P.D.,

Meehl, G.A., Roeckner, E., Sengupta, S. and Taylor K.E., 2001: Accounting for the

effects of volcanoes and ENSO in comparisons of modeled and observed temperature

trends. Journal of Geophysical Research 106, 28033-28059.

Finally I've attached a paper I wrote in 1990, where I did something similar to what they did. I looked at residuals from a Gaussian filter, and I added the smoothed data back afterwards. I was working at the annual timescale and I did have many more years.

Cheers
Phil

On Jul 23, 2009, at 3:51 PM, Kevin Trenberth wrote:

I just looked briefly at the paper. Their relationships use derivatives of the series. Well derivatives are equivalent to a high pass filter, that is to say it filters out all the low frequency variability and trends.

If one takes $y = A \sin wt$

and does a differentiation one gets

$dy = Aw \cos wt$.

So the amplitude goes from A to Aw where w is the frequency = $2\pi/L$ where

L is the period.

So the response to this procedure is to reduce periods of 10

years by a
factor of 5 compared with periods of 2 years, or 20 and 50 years
get
reduced by factors of 10 and 25 relative to two year periods.
i.e. Their
procedure is designed to only analyse the interannual variability
not the
trends.
Kevin

hi Seth, you always seem to catch me at airports. only got a few
minutes. took a cursory look at the paper, and it has all the
worry
signs of extremely bad science and scholarship. JGR is a legitimate
journal, but some extremely bad papers have slipped through the
cracks
in recent years, and this is another one of them.
first of all, the authors use two deeply flawed datasets that
understate the warming trends: the Christy and Spencer MSU data and
uncorrected radiosonde temperature estimates. There were a series
of
three key papers published in Science a few years ago, by Mears
et al,
Santer et al, and Sherwood et al.
see Gavin's excellent RealClimate article on this:
[73]<http://www.realclimate.org/index.php/archives/2005/08/et-tu-lt/>
these papers collectively showed that both datasets were deeply
flawed
and understate actual tropospheric temperature trends. I find it
absolutely remarkable that this paper could get through a serious
review w/out referencing any 3 of these critical papers--papers
whose
findings render that conclusions of the current article completely
invalid!
The Christy and Spencer MSU satellite-derived tropospheric
temperature
estimates contained two errors--a sign error and an algebraic
error--
that had the net effect of artificially removing the warming trend.
Christy and Spencer continue to produce revised versions of the MSU
dataset, but they always seem to show less warming than every other
independent assessment, and their estimates are largely
disregarded by
serious assessments such as that done by the NAS and the IPCC.
So these guys have taken biased estimates of tropospheric
temperatures
that have artificially too little warming trend, and then shown,
quite
unremarkably, that El Nino dominates much of what is left (the
interannual variability).
the paper has absolutely no implications that I can see at all
for the
role of natural variability on the observed warming trend of recent
decades.

other far more careful analyses (a paper by David Thompson of CSU, Phil Jones, and others published in Nature more than year ago) used proper, widely-accepted surface temperature data to estimate the influence of natural factors (El Nino and volcanos) on the surface temperature record. their analysis was so careful and clever that it detected a post-world war II error in sea surface temperature measurements (that yields artificial cooling during the mid 1940s) that had never before been discovered in the global surface temperature record. needless to say, they removed that error too. and the correct record, removing influences of ENSO, volcanoes, and even this newly detected error, reveal that a robust warming of global mean surface temperature over the past century of a little less than 1C which has nothing to do w/ volcanic influences or ENSO influences. the dominant source of the overall warming, as concluded in every legitimate major scientific assessment, is anthropogenic influences (human greenhouse gas concentrations w/ some offsetting cooling due to sulphate aerosols). this later paper provides absolutely nothing to cast that in doubt. it uses a flawed set of surface temperature measurements for which the trend has been artificially suppressed, to show that whats left over (interannual variability) is due to natural influences. duh! its a joke! and the aptly named Mark "Morano" has fallen for it!

Date: Tue Jul 28 10:15:45 2009

Cc: trenbert@ucar.edu, j.renwick@niwa.co.nz, b.mullan@niwa.co.nz, Gavin Schmidt <gschmidt@giss.nasa.gov>

Jim et al,

Having now read the paper in a moment of peace and quiet, there are a few things to bear in mind. The authors of the original will have a right of reply, so need to ensure that they don't have anything to come back on. From doing the attached a year or so ago, there is a word limit and also it is important to concentrate only on a few key points. As we all know there is so much wrong with the paper, it won't be difficult to come up with a few, but it does need to be just two or three.

The three aspects I would emphasize are

1. The first difference type filtering. Para 14 implies that they smooth the series with a 12 month running mean, then subtract the value in Jan 1980 from that in Jan 1979, then Feb 1980 from Feb 1979 and so on. As we know this removes any long-term trend.

The running mean also probably distorts the phase, so this is possibly why they get different lags from others. Using running means also enhances the explained variance. Perhaps we should repeat the exercise without the smoothing.

2. Figure 4 and Figure 1 show the unsmoothed GTTA series. These clearly have a trend. Perhaps show the residual after extracting the ENSO part.

3. They do the same first difference on the smoothed SOI. The SOI doesn't explain the climate jump in the 1976/77 period. Their arguments in para 30 are all wrong.

A few minor points

- there are some negative R^2 values just after equation 3.

- I'm sure Tom Wigley wouldn't have proposed El Nino events occurring after volcanoes!

Attached this paper as well. From a quick read it doesn't say what is purported - in fact

it seems to show clearly how the analysis should have been done.

- there is a paper by Ben Santer (more recent) where he applies the same type of extraction procedure to models. I'll send this separately as it is large. In case it is too large here is the reference.

Santer, B.D., Wigley, T.M.L., Doutriaux, C., Boyle, J.S., Hansen, J.E., Jones, P.D., Meehl, G.A., Roeckner, E., Sengupta, S. and Taylor K.E., 2001: Accounting for the effects of volcanoes and ENSO in comparisons of modeled and observed temperature trends. *Journal of Geophysical Research* 106, 2803328059.

Finally I've attached a paper I wrote in 1990, where I did something similar to what they did. I looked at residuals from a Gaussian filter, and I added the smoothed data back afterwards. I was working at the annual timescale and I did have many more years.

Cheers

Phil

Hi Jim,

Grant Foster ('Tamino') did a nice job in a previous response (attached) we wrote to a similarly bad article by Schwartz which got a lot of play in contrarian circles. since he's already done some of the initial work in debunking this, I sent him an email asking hi if we was interested in spearheading a similar effort w/ this one. let me get back to folks after I've heard back from him, and we can discuss possible strategy for moving this forward,

mike

On Jul 24, 2009, at 6:11 PM, Jim Salinger wrote:

Kia orana All from the Tropical South Pacific

Yes, Phil, a bit like 'A midsummer night's dream!'. and Gavin Tamino's bang up job is great, And good that you go up with stuff on Real Climate, Mike. As Kevin is preoccupied, for the scientific record we need a rebuttal somewhere pulled together. Who wants to join in on the multiauthored effort?? I am happy to coordinate it. Return to 'winter' this evening after enjoying a balmy south east trades and sunny dry 24 C in the Cook Islands.

Jim

Quoting Michael Mann <[13]mann@meteo.psu.edu>:

folks, we're going to go up w/ something brief on RealClimate later today, mostly just linking to other useful deconstructions of the paper already up on other sites,

mike

On Jul 23, 2009, at 11:01 PM, Jim Salinger wrote:

I am tied up next week, but could frame something up the following week which , I hope would be multi-authored. It would be quite good to have a rebuttal from the same Department at Uni of Auckland (which Glenn McGregor of IJC is director of)! I haven't had the opportunity to download the text here in the Cook Islands, so this would give me the opportunity to do that. Who else wants to join in??

Jim

Quoting Kevin Trenberth <[14]trenbert@ucar.edu>:

I am on vacation today and don't have the time. I have been on travel the past 4 weeks (including AR5 IPCC scoping mtg); the NCAR summer Colloquium is coming up in a week and then I am off to Oz and NZ for 3 weeks (GEWEX/iLeaps, CEOP) and I have an oceanobs'09 plenary paper to do.

Kevin

a formal comment to JGR seems like a worthwhile undertaking here. contrarians will continue to cite the paper regardless of whether or not its been rebutted, but for the purpose of future scientific assessments, its important that this be formally rebutted in the peer-reviewed literature.

mike

On Jul 23, 2009, at 9:05 PM, Jim Salinger wrote:

Hi All

Thanks for the pro-activeness. Is there an opportunity to write a letter to JGR pointing out the junk science in this??....if it is not rebutted, then all sceptics will use this to justify their position.

Jim

Quoting Michael Mann <[15]mann@meteo.psu.edu>:

2nd email

Thanks Kevin, hadn't even noticed that in my terse initial skim of it. yes--that makes things even worse than my initial impression. this is a truly horrible paper. one wonders who the editor was, and what he/she was thinking (or drinking),

m

On Jul 23, 2009, at 3:51 PM, Kevin Trenberth wrote:

I just looked briefly at the paper. Their relationships use derivatives of the series. Well derivatives are equivalent to a high pass filter, that is to say it filters out all the low frequency variability and trends.

If one takes $y = A \sin wt$ and does a differentiation one gets

$dy = Aw \cos wt$.

So the amplitude goes from A to Aw where w is the frequency = $2\pi/L$ where

L is the period.

So the response to this procedure is to reduce periods of 10 years by a factor of 5 compared with periods of 2 years, or 20 and 50 years get reduced by factors of 10 and 25 relative to two year periods.

i.e. Their procedure is designed to only analyse the interannual variability not the trends.

Kevin

hi Seth, you always seem to catch me at airports. only got a few minutes. took a cursory look at the paper, and it has all the worry signs of extremely bad science and scholarship. JGR is a legitimate journal, but some extremely bad papers have slipped through the cracks in recent years, and this is another one of them.

first of all, the authors use two deeply flawed datasets that understate the warming trends: the Christy and Spencer MSU data and uncorrected radiosonde temperature estimates. There were a series of three key papers published in Science a few years ago, by Mears et al,

Santer et al, and Sherwood et al.

see Gavin's excellent RealClimate article on this:

[16]<http://www.realclimate.org/index.php/archives/2005/08/et-tu-lt/>

these papers collectively showed that both datasets were deeply flawed

and understate actual tropospheric temperature trends. I find it absolutely remarkable that this paper could get through a serious review w/out referencing any 3 of these critical papers--papers whose

findings render that conclusions of the current article completely invalid!

The Christy and Spencer MSU satellite-derived tropospheric temperature

estimates contained two errors--a sign error and an algebraic error--

that had the net effect of artificially removing the warming trend.

Christy and Spencer continue to produce revised versions of the MSU dataset, but they always seem to show less warming than every other independent assessment, and their estimates are largely disregarded by

serious assessments such as that done by the NAS and the IPCC.

So these guys have taken biased estimates of tropospheric temperatures

that have artificially too little warming trend, and then shown, quite

unremarkably, that El Nino dominates much of what is left (the interannual variability).

the paper has absolutely no implications that I can see at all for the

role of natural variability on the observed warming trend of recent decades.

other far more careful analyses (a paper by David Thompson of CSU, Phil Jones, and others published in Nature more than year ago) used

proper, widely-accepted surface temperature data to estimate the influence of natural factors (El Nino and volcanos) on the surface temperature record. their analysis was so careful and clever that it

detected a post-world war II error in sea surface temperature measurements (that yields artificial cooling during the mid 1940s) that had never before been discovered in the global surface

temperature record. needless to say, they removed that error too.
and
the correct record, removing influences of ENSO, volcanoes, and
even
this newly detected error, reveal that a robust warming of
global mean
surface temperature over the past century of a little less than 1C
which has nothing to do w/ volcanic influences or ENSO
influences. the
dominant source of the overall warming, as concluded in every
legitimate major scientific assessment, is anthropogenic
influences
(human greenhouse gas concentrations w/ some offsetting cooling
due to
sulphate aerosols).
this later paper provides absolutely nothing to cast that in
doubt. it
uses a flawed set of surface temperature measurements for which the
trend has been artificially suppressed, to show that whats left
over
(interannual variability) is due to natural influences. duh!
its a joke! and the aptly named Mark "Morano" has fallen for it!

<jdannan@jamstec.go.jp>

Hi all

Wow this is a nice analysis by Grant et al. What we should do is turn this into a learning

experience for everyone: there is often misuse of filtering.

Obviously the editor and

reviewers need to to also be taken to task here. I agree with Mike Mann that a couple of

other key points deserve to be made wrt this paper. Making sure that the important

relationships and role of ENSO on interannual variability of global temperatures should

also be pointed out with some select references (as in recent emails and the refs

therein). In terms of the paper, I recommend consolidating the figures to keep them fewer

in number if this is a comment: combine Figs 3 with 4 , and 6 with 7.

Make sure the plots

of spectra have period prominently displayed as well as frequency and maybe even highlight

with stipple some bands like >10 years. Glad to sign on: I would need an acknowledgment

that NCAR is sponsored by NSF.

Regards

Kevin

Michael Mann wrote:

thanks Grant, the paper is starting to shape up well now. Jim and I (well, mostly Jim,

w/ some input from me) are iterating on a blurb about past studies on ENSO/temperature

relationships and should have something for you soon on that,

As James has pointed out, its important to stick to the key points and not get sidetracked

with nonsense. I would avoid any commentary on their ignorant ramblings about the Hadley

Cell, etc. We want to cut straight to the deep flaws in their analysis which are, in order

of importance in my view,

1. indefensible use of a differencing filter, which has the effect of selectively damping

low-frequency variability and renders any conclusions about factors underlying long-term

trends completely spurious.

2. ignoring the fact that the influence of ENSO on global temperature has been known for decades, and much better quantified in past studies than in the current deeply flawed analysis.

3. the selective use of a flawed temperature data and curious splicing in of inappropriate recent data (UAH TMT) to further suppress trends. A bit of overkill given that they already eliminated the trends anyway. Guess they wanted to play it extra cautious just in case some bit of warming trend tried to sneak in.

The other stuff is just a distraction.

mike

On Jul 29, 2009, at 10:51 AM, Grant Foster wrote:

Gentlemen,

Attached is a zip file with LaTeX and pdf for a first draft. I've included everybody's name (in alphabetical order after mine), but of course it should only include in submission those who give explicit consent.

There are a few other issues. One is that MFC have recently removed the pdf version of their paper from the "New Zealand Climate Coalition" website. They've replaced it with this:

[1]http://nzclimatescience.net/index.php?option=com_content&task=view&id=502&Itemid=1

which refers to a graph showing only part of figure 7, and suggests that there's not trend

in GTTA so "nothing to worry about." Yet the plotted GTTA is from UAH TMT (*not* TLT) so

of course it shows no trend, and the MT channel is contaminated by stratospheric cooling.

In figure 7 of the paper itself they compare the 50-year record of SOI and GTTA, but their

graph of GTTA is made of RATPAC-A data until 1980 grafted onto UAH TMT data afterward --

hence the lack of an obvious trend. I think this too should be mentioned, especially as

the entire RATPAC-A record shows a very pronounced trend.

One last thing: there's a lot of stuff in the paper about Hadley cells and heat transport

and so forth. I suspect this is really a bunch of gobbledygook -- but I don't know. But

I'll bet you guys do. Comments?

Sincerely,

Grant

From: Phil Jones <p.jones@uea.ac.uk>
To: Thomas.C.Peterson@noaa.gov
Subject: Re: This and that
Date: Wed Jul 29 17:19:53 2009

Tom,

Good idea with that BAMS paper. There is also the KNMI web site, which tells that they have restricted data from Europe - on the ECA part. Both despite WMO-Res40!

On IPCC, I suggested Thomas to not get too many hangers on amongst the LAs. Chs 2 and 14 are prime candidates for upping the geographic spread. We had about half of ours not doing that much last time.

Isn't Tom Karl on the US nominating committee?

Away all day tomorrow - CRU barbecue - so will pour down.

Cheers

Phil

At 17:07 29/07/2009, you wrote:

Hi, Phil,

Yes, Friday-Saturday I noticed that ClimateFraudit had renewed their interest in you. I was thinking about sending an email of sympathy, but I was busy preparing for a quick trip to Hawaii - I left Monday morning and flew out Tuesday evening and am now in the Houston airport on my way home.

Data that we can't release is a tricky thing here at NCDC. Periodically, Tom Karl will twist my arm to release data that would violate agreements and therefore hurt us in the long run, so I would prefer that you don't specifically cite me or NCDC in this.

But I can give you a good alternative. You can point to the Peterson-Manton article on regional climate change workshops. All those workshops resulted in data being provided to the author of the peer-reviewed paper with a strict promise that none of the data would be released. So far as far as I know, we have all lived up to that agreement - myself with the Caribbean data (so that is one example of data I have that are not released by NCDC), Lucie and Malcolm for South America, Enric for Central America, Xuebin for Middle Eastern data, Albert for south/central Asian data, John Ceasar for SE Asia, Enric again for central Africa, etc. The point being that such agreements are common and are the only way that we have access to quantitative insights into climate change in many parts of the world. Many countries don't mind the release of derived products such as your gridded field or Xuebin's ETCCDI indices, but very much object to the release of actual

data (which they might sell to potential users). Does that help?

Regarding AR4, I would like to be part of it. I have no idea what role would be deemed appropriate. One thing I noticed with the CLAs in my old chapter is that if one isn't up to doing his part (too busy, or a different concept of timeliness, or ...) it can make for a difficult job. You and I have worked well together before (e.g., GSN) so I'd be delighted to work with you on it and I know you'd hold up your side of the tasks. We touched on this briefly at the AOPC meeting. If I get an opportunity, I would say yes.

But I also don't know what the U.S. IPCC nominating approach would be or even who decides that. There is an upcoming IPCC report on extremes and impacts of extremes and I wasn't privy to any insights into the U.S. nominations other than when it was over it was announced in NCDC staff notes that the nominations had been made. However, Kumar had earlier asked if he could nominate me, so he did (I provided him with the details).

Regards,

Tom

Tom,

If you look on Climate Audit you will see that I'm all over it! Our ftp site is regularly trawled as I guess yours is. It seems that a Canadian along with two Americans copied some files we put there for MOHC in early 2003. So saying they have the CRU data is not quite correct. What they have is our raw data for CRUTEM2 which went into Jones and Moberg (2003) - data through end of 2002.

Anyway enough of my problems - I have a question for you. I'm going to write a small document for our web site to satisfy (probably the wrong word) the 50 or so FOI/EIR requests we've had over the weekend. I will put up the various agreements we have with Met Services.

The question - I think you told me one time that you had a file containing all the data you couldn't release (i.e. it's not in GHCN). Presumably this is not in your gridded datasets? Do you know off hand how much data is in this category? Would NCDC mind if I mentioned that you have such data - not the amount/locations/anything, just that there is some?

On something positive - attached is the outlines for the proposed Chs in AR5/WG1. Ch1 is something Thomas thinks he can write himself - well with Qin Dahe, so only 13 chapters. There are a lot of issues with overlaps between some of the data chapters 2 with 3, 2 with 5 and 2 with 14.

I'm still thinking about whether to get involved. It would be 2 if I decide. At the moment I'd say yes, but I might change my mind tomorrow! Nominations are from Nov09 thru Jan10 with the selection made in April 10. Are you considering getting involved?

I have got the IPCC Secretariat and Thomas to raise the FOI issues with the full IPCC Plenary, which meets in Bali in September or October. Thomas is fully aware of all the issues we've had here wrt Ch 6 last time, and others in the US have had.

Cheers

Phil

See some suggested mods

BTW the T et al 2002 paper was one that got horribly caught up in the JGR transition to electronic publication and the doi etc was not properly set.

It was not published on time but delayed by some 6 months when about 10 issues came out all at once, and no one read it!

Gentlemen,
I've combined everything (I hope!) into the latest revision. I've probably made some glaring mistake somewhere, so read it critically. It's also necessary to ensure that it all fits together coherently, and that anything we claim we'll do is actually done. I want this to be airtight, let's not leave them any "wiggle room."
Referring to the inappropriate application of filters, I have a feeling that saying "perhaps not an uncommon error" is too easy on them. I have no motivation to go easy on them. Perhaps I'm being too aggressive; I defer to the majority opinion.
On a few technical details, I need altaffils and authoraddresses for everybody. And make sure I've got your name right!
Sincerely,
Grant

<x-flowed>
Dear Tom,

Thanks for forwarding the message from John Christy. Excuse me for being so blunt, but John's message is just a load of utter garbage.

I got a laugh out of John's claim that Santer et al. (2008) was "poorly done". This was kind of ironic coming from a co-author of the Douglass et al. (2007) paper, which used a fundamentally flawed statistical test to compare modeled and observed tropospheric temperature trends. To my knowledge, John has NEVER acknowledged that Douglass et al. used a flawed statistical test to reach incorrect conclusions - despite unequivocal evidence from the "synthetic data" experiments in Santer et al. (2008) that the Douglass et al. "robust consistency" test was simply wrong. Unbelievably, Christy continues to assert that the results of Douglass et al. (2007) "still stand". I can only shake my head in amazement at such intellectual dishonesty. I guess the best form of defense is a "robust" attack.

So how does John support his contention that Santer et al. (2008) was "poorly done"? He begins by stating that:

"Santer et al. 2008 used ERSST data which I understand has now been changed in a way that discredits the conclusion there".

Maybe you or Tom Peterson or Dick Reynolds can enlighten me on this one. How exactly have NOAA ERSST surface data changed? Recall that Santer et al. (2008) actually used two different versions of the ERSST data (version 2 and version 3). We also used HadISST sea-surface temperature data, and combined SSTs and land 2m temperature data from HadCRUT3v. In other words, we used four different observational estimates of surface temperature changes. Our bottom-line conclusion (no significant discrepancy between modeled and observed lower-tropospheric lapse-rate trends) was not sensitive to our choice of observed surface temperature dataset.

John next asserts that:

"Haimberger's v1.2-1.4 (of the radiosonde data) are clearly spurious due

to the error in ECMWF as published many places".

I'll let Leo Haimberger respond to that one. And if v1.2 of Leo's data is "clearly spurious", why did John Christy agree to be a co-author on the Douglass et al. paper which uses upper-air data from v1.2?

Santer et al. (2008) comprehensively examined structural uncertainties in the observed upper-air datasets. They looked at two different satellite and seven different radiosonde-based estimates of tropospheric temperature change. As in the case of the surface temperature data, getting the statistical test right was much more important (in terms of the bottom-line conclusions) than the choice of observational upper-air dataset.

Christy's next criticism of our IJoC paper is even more absurd. He states that:

"Santer et al. 2008 asked a very different question...than we did. Our question was "Does the IPCC BEST ESTIMATE agree with the Best Data (including RSS)?" Answer - No. Santer et al. asked, "Does ANY IPCC model agree with ANY data set?" ... I think you can see the difference.

Actually, we asked and answered BOTH of these questions. "Tests with individual model realizations" are described in Section 4.1 of Santer et al. (2008), while Section 4.2 covers "Tests with multi-model ensemble-mean trend". As should be obvious - even to John Christy - we did NOT just compare observations with results from individual models.

For both types of test ("individual model" and "multi-model average"), we found that, if one applied appropriate statistical tests (which Douglass et al. failed to do), there was no longer a serious discrepancy between modeled and observed trends in tropical lapse rates or in tropical tropospheric temperatures.

Again, I find myself shaking my head in amazement. How can John make such patently false claims about our paper? The kindest interpretation is that he is a complete idiot, and has not even bothered to read Santer et al. (2008) before making erroneous criticisms of it. The less kind interpretation is that he is deliberately lying.

A good scientist is willing to acknowledge the errors he or she commits (such as applying an inappropriate statistical test). John Christy is not a good scientist. I'm not a religious man, but I'm sure willing to thank some higher authority that Dr. John Christy is not the "gatekeeper" of what constitutes sound science.

I hope you don't mind, Tom, but I'm copying this email to some of the other co-authors of the Santer et al. (2008) IJoC paper. They deserve to know about the kind of disinformation Christy is spreading.

With best regards,

Ben

You have a go from me. By all means clean up. I think you should argue that it should be expedited for the reasons of interest by the press. Key question is who was the editor who handled the original, because this is an implicit criticism of that person. May need to point this out and ensure that someone else handles it.

Thanks
Kevin

folks, I was thinking exactly the same thing. the problems are so unusually fundamental and obvious, as we lay them out, that it does immediately call into suspicion the integrity of the review process.

We probably need to take this directly to the chief editor at JGR, asking that this not be handled by the editor who presided over the original paper, as this would represent a conflict of interest. if we are told that is not possible, then we would at least want the chief editor himself to closely monitor the handling of the paper.

I too am happy to sign of at this point,

mike

Gentlemen,

I've added additional suggestions received today, and made a few minor

changes myself. Here's the latest version. Enjoy!

Sincerely,

Grant

My colleague Emma and I are submitting everything this morning. I'm doing the email version, Emma the 4 hard copies to the office in York before 2pm.

Peter provided a very useful edit yesterday which has got the proposal down under 4,000 words.

Please find attached:

1. Proposal registration form (I have just put in CAG details as main proposer but flagged up its a partnership bid)
2. Summary (just under 600 words as required)
3. Proposal
4. Budget form (their's and an extra one they agreed I could do to show who does what days - don't worry about days shown - its provisional - we can revise and rearrange it if we get the job!)
5. Staff Costs forms (attached to the budget form but not filled in as they agreed we didn't have to submit these - they don't work with day rates)
6. Full CVs for all Proposers (Emma is adding in some final material she has but couldnt access yesterday - we will send round the very final version for your records once done this morning)
7. Three appendices as one Word document (to go with the proposal but separately so as not to increase the word count of the proposal)
8. A rather long covering letter to go with email and hard copy versions.

If you notice I've missed something please email me!
Thanks to everyone for the their work on this. Very much appreciated.
I will let you know as soon as I hear anything.

best wishes

Susan

Peter,

Don't know if you got this. There is a link below to something Tom P said.

Keith is fine - seems as though there nothing malignant or cancerous in the post op tests. Just needs to ensure the scar heals OK, then he can come back to the madhouse.

Cheers

Phil

Tom,

If you look on Climate Audit you will see that I'm all over it!
Our ftp site is regularly trawled as I guess yours is. It seems that
a Canadian along with two Americans copied some files we put there
for MOHC in early 2003. So saying they have the CRU data is not
quite correct. What they have is our raw data for CRUTEM2 which
went into Jones and Moberg (2003) - data through end of 2002.

Anyway enough of my problems - I have a question for you. I'm
going to write a small document for our web site to satisfy (probably the
wrong word) the 50 or so FOI/EIR requests we've had over the weekend.
I will put up the various agreements we have with Met Services.

The question - I think you told me one time that you had a file containing all the data you couldn't release (i.e. it's not in GHCN). Presumably this is not in your gridded datasets? Do you know off hand how much data is in this category? Would NCDC mind if I mentioned that you have such data - not the amount/locations/anything, just that there is some?

On something positive - attached is the outlines for the proposed Chs in AR5/WG1. Ch1 is something Thomas thinks he can write himself - well with Qin Dahe, so only 13 chapters. There are a lot of issues with overlaps between some of the data chapters 2 with 3, 2 with 5 and 2 with 14.

I'm still thinking about whether to get involved. It would be 2 if I decide. At the moment I'd say yes, but I might change my mind tomorrow! Nominations are from Nov09 thru Jan10 with the selection made in April 10. Are you considering getting involved?

I have got the IPCC Secretariat and Thomas to raise the FOI issues with the full IPCC Plenary, which meets in Bali in September or October. Thomas is fully aware of all the issues we've had here wrt Ch 6 last time, and others in the US have had.

Cheers

Phil

Subject: RE: ENSO blamed over warming - paper in JGR

Date: Fri, 31 Jul 2009 10:54:57 +0000

Cc: <j.renwick@niwa.co.nz>, Mike Mann <mann@meteo.psu.edu>, <trenbert@ucar.edu>, Gavin Schmidt <gschmidt@giss.nasa.gov>, James Annan <jdannan@jamstec.go.jp>, <b.mullan@niwa.co.nz>

Gentlemen,

We're very close to being ready for submission; here's the latest version. I suggest a close reading, and don't forget to point out all the typos you notice.

James, since you can cover the page charges I suggest you handle the actual submission (when the time comes). Would you be willing to write the cover letter? Any other volunteers?

So far I've produced versions in 2-column format with graphs inline (so we can all see what it'll look like), but when we're ready I'll create a draft version with all the figures at the end (or if you really want to James, you can do this as well). The 2-column version takes jpg files as input, but I've already created eps files for all the figures.

I *think* I've got everybody's suggestions in here, but if I've missed anything or you have further suggestions send 'em along. We're still waiting for explicit consent (and affiliation info) from B. Mullan and G. Schmidt! If either of you fellas would rather opt out that's OK -- as far as I'm concerned you're completely welcome to join or to decline. If we're as close as I think, we may be ready by Monday.

Thanks, Phil, for the link to the video; a good laugh! Maybe the most amusing blog post I've seen about MFC09 is this one:

<http://deepclimate.org/2009/07/30/is-enso-responsible-for-recent-global-warming-no/>

What amuses me most is that "in its original news item on the paper, the International Climate Science Coalition had actually substituted the title of the first press release for for the actual title in its link to the paper ... That's right according to the ICSC, the papers title was Nature, not Man, is responsible for global warming. Stop the presses!

Grant et al

All good to me apart from adding in the IPCC 2007 WG1 Chap 3 reference.

I checked with IJC chief editor here (Glenn McGregor) and editors usually like to publish comments asap, and send them only to the original authors to respond to as soon as possible.

So once the USA contingent has signed it off 'today' (Friday) and submitted it, I will send a copy to our Australian colleagues for information.

All good stuff

Best

Auckland Jim

Hi Grant,

I have been tied up with other things. In looking at the paper some questions.

1) In Fig 1, why is the scale zero to 2? Normally a filter would be scaled to have a response function zero to 1.

2) In Fig 2 and 3 what are the units of "power"? It is not in the caption. Are these normalized spectra so that the area under the curve is unity? My guess is that this is the case and hence the amplification at ENSO bands. But it is important to say this and perhaps point out. Maybe the captions are sufficient? Add something like: The spectra have been normalized to have unit variance, which relatively inflates the values in the 0.2 to 0.5 frequency band. In a couple of places in text add "normalized" before "power spectrum" such as 2 lines above Fig 3 in the JGR set version.

3) A minor point: in the $x = \sin(2\pi vt)$ I would be inclined to add an amplitude which would then be included also in eq (1) on RHS emphasizing how the amplitude is changed. [My own preference would be to call the amplitude A and the A you have R (for response function)]. However it is fine as is.

Thanks

Kevin

Grant Foster wrote:

Gentlemen,

Well, I got some free time and it didn't take as long as I expected. Attached are:

comment.zip Comment in preprint form

draft.zip Comment in draft form (for submission)

freeform.zip Comment NOT as preprint or draft, with larger font and double-wide graphs

I suggest we don't circulate it until folks have had one further day to check. And double check and triple-check. If we don't hear an objection by tomorrow morning, I suggest we submit it to JGR and feel free to circulate it.

So -- this is your last chance to suggest changes before submission, or to suggest restraint in circulation.

Sincerely,

Grant

Dear James

From the Land of the Long White Cloud to the Land of the Rising Sun....

Should we not also inquire about their time line for publishing the comment, and on the basis that is so serious, and the implications of their flawed findings ask it to be expedited.

Perhaps

We also note that the paper is now being used as the basis of campaigns against climate change policy and, should you decide to go ahead and publish our comment, expedite its acceptance.

Best

Auckland James

Hi all,

Agree with Kevin that Tom Karl has too much to do. Tom Wigley is semi retired and like Mike Wallace may not be responsive to requests from JGR.

We have Ben Santer in common ! Dave Thompson is a good suggestion. I'd go for one of Tom Peterson or Dave Easterling.

To get a spread, I'd go with 3 US, One Australian and one in Europe. So Neville Nicholls and David Parker.

All of them know the sorts of things to say - about our comment and the awful original, without any prompting.

Cheers

Phil

Dear Tom,

I'm inclined to agree with Mike. Some people are accessible to rational scientific debate. They are good Bayesians - when confronted with new scientific information, they are capable of modifying previously-held views. John Christy is not accessible to rational scientific debate. New evidence does not cause him to change his views. He simply claims that the new evidence is wrong. From John's perspective, any datasets in disagreement with UAH-based estimates of tropospheric temperature change constitute "bad data".

John is incapable of recognizing and admitting that Douglass et al. used a flawed statistical test to reach incorrect conclusions. He continues to misrepresent the analyses we performed in our response to Douglass et al. I don't see what useful purpose can be served by trying to engage him in reasonable scientific debate.

At the Hawaii IPCC meeting in March, John stood up in front of an audience of IPCC Working Group I Lead Authors and attempted to portray himself as a victim of scientific discrimination. He claimed that his "alternative" views on the nature and causes of climate change were being ignored by the mainstream scientific community. This claim is bogus. The "mainstream" scientific community has not ignored the "alternative" views of folks like John Christy. The sad reality is that we've wasted an inordinate amount of time responding to the flawed science and incorrect claims of John and his colleagues.

I'm hopeful that I won't have to waste much more time on the "great satellite debate". In my personal opinion, we're already well past the point of diminishing returns on this debate. The point of diminishing returns was reached three years ago, when you overcame great obstacles to lead a fractious bunch of scientists to the successful completion of the first CCSP Report.

With best regards,

Ben

good news Grant, we can trust him to be professional.

on a related note, a few folks have expressed concern that the galley-formatting of the article w/out any label such as "submitted to JGR" is a bit misleading. some people think the paper has already gone to press!

we should add a clear label such as "sub judice" or "submitted" to any posted and/or circulating version of this,

mike

p.s. I've already had to correct both Andy Revkin and Joe Romm on this!

Mike, Gavin,

See the attached - odd quote by McIntyre in the middle of this
.. he is not interested in challenging the science of climate change or in nit-picking,
but is simply asking that the data be made available. "The only policy I want people to
change is their data-access policy"

I must have been in a parallel universe for the past 7-8 years!

The CRU web page referred to in the article is this one.

[1]<http://www.cru.uea.ac.uk/cru/data/availability/>

I'm off at noon today - back in on Aug 20. I'll be checking email once a day,
but will not be looking at blog sites.

Olive Heffernan at Nature expects the Nature blog site to be hijacked by the deniers.
She also said she would put up an expanded article, but I can't see this.

Cheers

Phil

Nick,

Apologies if I've asked you this before, but I'm being asked about the ECOCHANGE budget that appears to be available to UEA.

With the UEA budget there is money in categories that UEA has not had money in before (in other EU projects). Do you know what this money is supposed to be for? We understand the budget for personnel and also travel, but it is the other categories - which seem to relate to more travel and costs for capital equipment.

Keith is still off work, but is recovering well from his operation. I'm off in the next few hours for 2 weeks away.

Cheers

Phil

Nick,

Thanks. Perhaps I'll need to contact Keith
as to why some of the items are in the budget.

I understand about the salary money.

Cheers

Phil

<x-flowed>

Hi Tim

I've re-run with the same database used for the previous 2006 run (tmp.0705101334.dtb).

/cru/cruts/version_3_0/update_top/gridded_finals/data/data.0909041051/
tmp/cru_ts_3_00.1901.2008.tmp.dat.nc.gz

Is that any better? If not please can you send the traditional multi-page country plots for me to pore over?

Cheers

Harry

All:

I received my first hate mail this AM, which helped me to realize that I shouldn't be wasting time reading the blogs.

Regarding the "upside down man", as Nick's plot shows, when flipped, the Korttajarvi series has little impact on the overall reconstructions. Also, the series was not included in the calibration. Nonetheless, it's unfortunate that I flipped the Korttajarvi data. We used the density data as the temperature proxy, as recommended to me by Antti Ojala (co-author of the original work). It's weakly inversely related to organic matter content. I should have used the inverse of density as the temperature proxy. I probably got confused by the fact that the 20th century shows very high density values and I inadvertently equated that directly with temperature.

This is new territory for me, but not acknowledging an error might come back to bite us. I suggest that we nip it in the bud and write a brief update showing the corrected composite (Nick's graph) and post it to RealClimate. Do you all agree?

There's other criticisms that have come up by McIntyre's group:

(1) We cherry-picked the tree-ring series in Eurasia. Apparently this is old ground, but do we need to address why we chose the Yamal record over the Polar Urals? Apparently, there's also a record from the Indigirka River region, which might not have been published and doesn't seem to be included in Keith's recent summary. If we overlooked any record that met our criteria, I suggest that we explain why. Keith: are you back? Can Ray or Mike provide some advise?

(2) The correction for Dye-3 was criticized because the approach/rationale had not been reviewed independently on its own. Bo: has this procedure now been published anywhere?

(3) We didn't publish any error analysis (e.g., leave-one-out), but I recall that we did do some of that prior to publication. Would it be worthwhile including this in our update? The threshold-exceedence difference (O&B-style) does include a bootstrapped estimate of errors. That might suffice, but is not the record we use for the temperature calibration.

(4) We selected records that showed 20th century warming. The only records that I know of that go back 1000 years that we left out were from the Gulf of Alaska that are known to be related strongly to precipitation, not temperature, and we stated this upfront. Do we want to clarify that it would be inappropriate to use a record of precip to reconstruct temperature? Or do we want to assume that precip should increase with temperature and add those records in and show that the primary signals remain?

(5) McIntyre wrote to me to request the annual data series that we used to calculate the 10-year mean values (10-year means were up on the NOAA site the same AM as the paper was published). The only "non-published" data are the annual series from the ice cores (Agassiz, Dye-3, NGRIP, and Renland). We stated this in the footnote, but it does stretch our assertion that all of the data are available publicly. Bo: How do you want to proceed? Should I forward the annual data to McIntyre?

Please let me -- better yet, the entire group -- know whether you think we should post a revision on RealScience, and whether we should include a reply to other criticism (1 through 5 above). I'm also thinking that I should write to Ojala and Tiljander directly to apologize for inadvertently reversing their data.

Other thoughts or advise?

Darrell

D et al - Please write all emails as though they will be made public.
I would not rush and I would not respond to any of them until the best
strategy is
developed - don't want to waste anyone's time, including yours or
Mc's. Since the recon in
Science has an error, I think you do need to publish a correction in
Science. In that, you
can very briefly not it didn't affect the calibration, nor the final
result. I don't think
you have a choice here. And I don't think RealClimate alone is the
place for this, although
RC could be good for the bigger list of issues. Don't do it on Mc's
blog. But, it would be
good to hear from Ray and Mike, since they have the most experience in
getting it right.
Here are some other QUICK thoughts - don't count on me for the next
week. Proposal hell and
traveling.
Make sure you have Keith's feedback before saying anything about the
dendro aspects.
Don't know about Dye3 issue
Error analysis should be done and be the topic of another paper - it
wasn't included in
this paper, so it's something that should be done outside the peer-
review process. There is
lots of new research to be done, and someone should do it as time
allows. Don't get pushed
into something too rushed or preliminary, and your defense is that you
wrote a paper that
reviewed well and was published. The goal wasn't to do everything in
this paper.
#4 - your are absolutely right and that could be in a blog someplace,
or just let them go
ahead and do a stupid thing. If this was a climate field recon it
would be different, no?
#5 is tricky. Giving him the data would be good, but only if it is
yours to give. You can't
give him data that you got from others and are not allowed to share.
But, it would be nice
if he could have access to all the data that we used - that's the way
science is supposed
to work. See what Mike and Ray say...

Be careful, very careful. But now you know why I advocated redoing all the analyses a few months ago - to make sure we got it all right. We knew we'd get this scrutiny.

This paper has had great impact so far, so that's something to remember - its good work.

Thanks, peck

On 9/5/09 8:44 AM, "Darrell Kaufman" <[1]Darrell.Kaufman@nau.edu> wrote:

All:

I received my first hate mail this AM, which helped me to realize that I shouldn't be

wasting time reading the blogs.

Regarding the "upside down man", as Nick's plot shows, when flipped, the Korttajarvi

series has little impact on the overall reconstructions. Also, the series was not

included in the calibration. Nonetheless, it's unfortunate that I flipped the

Korttajarvi data. We used the density data as the temperature proxy, as recommended to

me by Antii Ojala (co-author of the original work). It's weakly inversely related to

organic matter content. I should have used the inverse of density as the temperature

proxy. I probably got confused by the fact that the 20th century shows very high density

values and I inadvertently equated that directly with temperature.

This is new territory for me, but not acknowledging an error might come back to bite us.

I suggest that we nip it in the bud and write a brief update showing the corrected

composite (Nick's graph) and post it to RealClimate. Do you all agree?

There's other criticisms that have come up by McIntyre's group:

(1) We cherry-picked the tree-ring series in Eurasia. Apparently this is old ground, but

do we need to address why we chose the Yamal record over the Polar Urals? Apparently,

there's also a record from the Indigirka River region, which might not have been

published and doesn't seem to be included in Keith's recent summary. If we overlooked

any record that met our criteria, I suggest that we explain why.

Keith: are you back?

Can Ray or Mike provide some advise?

(2) The correction for Dye-3 was criticized because the approach/rationale had not been

reviewed independently on its own. Bo: has this procedure now been published anywhere?

(3) We didn't publish any error analysis (e.g., leave-one-out), but I recall that we

did do some of that prior to publication. Would it be worthwhile including this in our update? The threshold-exceedence difference (O&B-style) does include a boot-strapped estimate of errors. That might suffice, but is not the record we use for the temperature calibration.

(4) We selected records that showed 20th century warming. The only records that I know of that go back 1000 years that we left out were from the Gulf of Alaska that are known to be related strongly to precipitation, not temperature, and we stated this upfront. Do we want to clarify that it would be inappropriate to use a record of precip to reconstruct temperature? Or do we want to assume that precip should increase with temperature and add those records in and show that the primary signals remain?

Bo and others:

Regarding the annual data: You're correct that we only use 10-year means throughout our calculations (Fig 2 shows annual values, but are not used in any calculation/conclusion).

In his e-mail to me, McIntyre requested the annual data that we say are not publicly available as a footnote to Table S1.

Unless anyone has another suggestion, I will reply and send him the 10-year data (which is already posted at NOAA-Paleoclimate) and explain that they were the basis for all of the calculations. He might want the annual data that the mean values were based on. I suppose we'll cross that bridge when we get to it.

Darrell

On Sep 6, 2009, at 5:42 AM, Bo Vinther wrote:

Hi Darrell

Sorry to hear that you are getting trouble for doing such a nice paper....I by the way

agree completely with Peck that we should not be rushed and that a correction probably should go into Science.

Anyway, let me answer the two questions you had for me:

2) Correcting ice core data for upstream effects should not be controversial (while not correcting in areas of flow should be highly controversial indeed!).

Upstream correction of delta-180 was in fact already done 30 years ago for the Milcent ice

core - a quick quote from Hammer et al. 1978, page 14:

"The delta values are corrected for decreasing deltas up-slope at the site of formation of the individual layers"

Hammer, C. U., H. B. Clausen, W. Dansgaard, N. Gundestrup, S. J. Johnsen and N. Reeh, Dating of Greenland ice cores by flow models, isotopes, volcanic debris, and continental dust, J. Glaciol., 20, 326, 1978.

So upstream correction of delta data from ice cores 8using ice flow models9 has in fact

been performed since the year I was born.....

5) I will suggest that we release the 1860-2000 section of the annually resolved ice core

data, as these are the data that go into figure 2 in the paper.

Such a limited release I can permit immediately.

Releasing everything is something different and I can't see the need - as far as I rememver

we are not presenting/using the 1-1859 part of the series in annual resolution anywhere in

the paper - or am I wrong?

Cheers.....Bo

Dear Claudia,

The 13th session of the Working Group on Climate Modelling (WGCM) is going to be taking place in San Francisco at the end of this month. PCMDI is hosting this event. I just received an invitation to talk about IDAG at this meeting. I'd be very happy to do this, but would appreciate some guidance from you and others regarding what aspects of IDAG you'd like me to discuss.

With best regards,

Ben

Hi Tom - please find the Esper article in question attached. The so-called Indigirka River data set is not yet available because it has not been published. I am currently working on that with Russian colleagues, and was indeed in Switzerland the week before last to work with one of them on specifically this. All being well, there will be an accepted manuscript before next summer, and at that point I will make the data freely available. Once we get to that point, I'll let you know, of course. Cheers, Malcolm

Dear all,

(Apologies Mike for email address confusion -- one of them will get you I hope.)

I need some help to finish a report I've had to write for EPRI -- which is due in a few days. Hence the questions below ...

(1) The Moberg paper (2005 Nature) is used by the skeptics as evidence that most of recent warming could still be natural. Has anyone published a critique/criticism of this? It seems to me take this work is fundamentally flawed. First, variance scaling is crap statistics as it produces results with far less explained variance than normal least-squares regression. Second, the paper seems to have no independent validation. Third, what happens if one just takes his low-frequency (numbered in his Fig. 1) points and calculates the area average? Surely this will have much greater variability than the full global mean? (If no-one has done this please let me know -- I can do it very easily myself.) But perhaps his scaling method circumvents this "problem"?

(2) What is the paper of Caspar's (with Doug Nychka) that shows that McIntyre is wrong? Are there other papers I should see/cite in this regard?

(3) What are the papers that explain what is wrong with the von Storch ECHO simulation? I think Tim Osborn did something on this.

Many thanks for your help,

Tom.

<x-flowed>

Phil,

Here are some speculations on correcting SSTs to partly explain the 1940s warming blip.

If you look at the attached plot you will see that the land also shows the 1940s blip (as I'm sure you know).

So, if we could reduce the ocean blip by, say, 0.15 degC, then this would be significant for the global mean -- but we'd still have to explain the land blip.

I've chosen 0.15 here deliberately. This still leaves an ocean blip, and i think one needs to have some form of ocean blip to explain the land blip (via either some common forcing, or ocean forcing land, or vice versa, or all of these). When you look at other blips, the land blips are 1.5 to 2 times (roughly) the ocean blips -- higher sensitivity plus thermal inertia effects. My 0.15 adjustment leaves things consistent with this, so you can see where I am coming from.

Removing ENSO does not affect this.

It would be good to remove at least part of the 1940s blip, but we are still left with "why the blip".

Let me go further. If you look at NH vs SH and the aerosol effect (qualitatively or with MAGICC) then with a reduced ocean blip we get continuous warming in the SH, and a cooling in the NH -- just as one would expect with mainly NH aerosols.

The other interesting thing is (as Foukal et al. note -- from MAGICC) that the 1910-40 warming cannot be solar. The Sun can get at most 10% of this with Wang et al solar, less with Foukal solar. So this may well be NADW, as Sarah and I noted in 1987

(and also Schlesinger later). A reduced SST blip in the 1940s makes the 1910-40 warming larger than the SH (which it currently is not) -- but not really enough.

So ... why was the SH so cold around 1910? Another SST problem? (SH/NH data also attached.)

This stuff is in a report I am writing for EPRI, so I'd appreciate any comments you (and Ben) might have.

Tom.

Tom,

A few thoughts

[1]http://ams.allenpress.com/archive/1520-0442/preprint/2009/pdf/10.1175_2009JCLI3089.1.pdf

This is a link to the longer Thompson et al paper. It isn't yet out in final form - Nov09 maybe?

[2]<http://wattsupwiththat.com/2009/09/24/a-look-at-the-thompson-et-al-paper-hi-tech-wiggle-matching-and-removal-of-natural-variables/>

is a link to wattsupwiththat - not looked through this apart from a quick scan. Dave Thompson just emailed me this over the weekend and said someone had been busy! They seemed to have not fully understood what was done.

Have looked at the plots. I'm told that the HadSST3 paper is fairly near to being submitted, but I've still yet to see a copy. More SST data have been added for the WW2 and WW1 periods, but according to John Kennedy they have not made much difference to these periods.

Here's the two ppts I think I showed in Boulder in June. These were from April 09, so don't know what these would look like now. SH is on the left and adjustment there seems larger, for some reason - probably just British ships there?

Maybe I'm misinterpreting what you're saying, but the adjustments won't reduce the 1940s blip but enhance it. It won't change the 1940-44 period, just raise the 10 years after Aug 45.

I expect MOHC are looking at the NH minus SH series re the aerosols. My view is that a cooler temps later in the 1950s and 1960s it is easier to explain.

Land warming in the 1940s and late 1930s is mainly high latitude in NH.

One other thing - MOHC are also revising the 1961-90 normals. This will likely have more effect in the SH.

With the SH around 1910s there is the issue of exposure problems in Australia - see Neville's paper.

This shouldn't be an issue in NZ - except maybe before 1880, but could be in southern South America. New work in Spain suggest screens got renewed about 1900, so maybe this happened in Chile and Argentina, but Mossmann was head of the Argentine NMS so he may have got them to use Stevenson screens early.

Neville has never been successful getting any OZ funding to sort out pre-1910 temps everywhere except Qld.

Here's a paper in CC on European exposure problems. There is also one on Spanish series.

Cheers

Phil

Dear All

Im afraid its bad news on the JRF bid. We were not selected.

The gist of the letter I have now received says the problem was that it went over the £100,000 mark for a single bid and was therefore out of contention on those grounds - they accepted I'd rung to check about this and so said they reviewed the proposal given 'the potential confusion' about this.

They also said "it was unfortunate that the proposal did not more clearly demonstrate how it could build on the findings from the existing review of social impacts CAG has conducted". (No mention of the 3,000 word word limit for the whole proposal).

I just want to say thanks again for all you great work on this. I do think JRF wrote a confusing and difficult brief and we did a good job despite their strange requirements.

I hope this won't put people bidding again should other suitable work come up.

all the best

Susan

ps I will be scanning their letter and will send round tomorrow.

Hi all

About time. Incidentally i gave a copy to Mike McPhaden and discussed it with him last week when we were together at the OceanObs'09 conference. Mike is President of AGU. Basically this is an acceptance with a couple of suggestions for extras, and some suggestions for toning down the rhetoric. I had already tried that a bit. My reaction is that the main thing is to expedite this. That means no extras unless it really makes sense. And removal of a few unnecessary words like "absolutely".

In the abstract, we have a number of such adjectives that could be removed: I agree with Rev 3 in this.

"greatly overstates" could be just "overstates" as it is reinforced better later.

"severely overestimates" could be just "overestimates"

"faulty analysis" maybe "flawed analysis"?

"extremely high" maybe "very high" or "unduly high"

I would leave last sentence alone though as the main comment.

A few more comments embedded below.

Grant Foster wrote:

> This paper does an excellent job of showing the errors in the analytical methods used by McLean et al. and why their conclusions
> about the influence of ENSO on global air temperature is incorrect.
> I have only a couple of suggestions to help clarify their analysis of the methods. First, a little more explanation of the comment about the time derivative reduced to an additive constant would help. Second, in the analysis of the artificial time series I think it would be interesting to show the results of both steps of filtering (running mean and derivative) as separate time series. This would help the reader understand why the filtering creates false correlations. The only other suggestion is to find a better adjective than "faulty" in the abstract to characterize the analysis.
>

It is not so easy to see the result from the derivative owing to the phase shift. The spectrum actually does a better job. I would address this comment in this way and change "faulty".

>
> Reviewer #2 (Comments):
>
> I think this comment on McLean et al can be published more or less as is.

>

> I have two comments

>

> First, in the abstract (page 3, line 15), I'm not sure that "inflating" is quite the right verb - the paper itself does not make the point that the filter constructed by McLean et al inflates power in the 2-6 year window. Perhaps "isolating" would be a better verb.

Yes it should not be in abstract if not in text. Need to point out that the response function in Fig. 1 is greater than unity and does "inflate". So adjust the text.

>

> Secondly, I think the points that are being made with Figures 4 and 5 could be strengthened by adding to the right of each plot of a pair of time series, a scatter plot of the pairs of values available at each time. Such a scatter plot would help to clearly illustrate the absence (upper panels) or presence (lower panels) of correlation between red and black values.

I don't think this helps. There is nothing to be gained from a scatter plot that a correlation or regression value does not summarize.

>

>

> Reviewer #3 (Comments):

>

> Accept pending major changes (mainly in style not scientific comment)

>

> The real mystery here, of course, is how the McLean et al. paper ever made it into JGR. How that happened, I have no idea. I can't see it ever getting published through J Climate. The analyses in McLean et al. are among the worst I have seen in the climate literature. The paper is also a poorly guised attack on the integrity of the climate community, and I guess that is why Foster et al. have taken the energy to contradict its findings.

>

> So the current paper (Foster et al.) should certainly be accepted. Someone needs to address the science in the McLean et al paper in the peer-reviewed literature. But the current paper could be - and should be - done better. That's why I am suggesting major changes before the paper is accepted. All of my suggestions have to do more with the tone and framing of the current paper, rather than its content.

>

> 1. As noted above, I agree McLean et al is problematic. But as it is written, the current paper almost stoops to the level of "blog diatribe". The current paper does not read like a peer-reviewed journal article. The tone is sometimes dramatic and sometimes accusatory. It is inconsistent with the language one normally encounters in the objectively-based, peer-reviewed literature. For examples...

> - In the abstract: Do you really need all of these adjectives?... 'greatly overstates'; 'severely overestimates'; 'faulty analysis'; 'extremely high'.

Agree, see above

> - In the introduction... 'Unfortunately, their conclusions are seriously in error...' strikes me as overly subjective. Better to say: 'We will demonstrate that their conclusions are strongly dependent on' or something like that...

Don't go that far. Could drop "seriously" but they are "in error"

> - Page X-6: 'tell us absolutely nothing'. Surely it's enough to state 'tell us nothing'.

agree

> - Page X-9: 'it is misleading...' That's a strong word. It may be true. But I think we should rise above such accusations.

misleading is OK. I did a search (not sure I have latest) and found "grossly misleading" and the "grossly" could be removed.

>
> Anyway, I'm sure the lead author gets my point. I think the current paper will have a much greater impact (and can claim the high road) if it is rewritten in a more objective manner.
>
> 2. Similarly, instead of framing the paper as "Taking down McLean et al.", why not focus more on interesting aspects of the science, such as the frequency dependence between ENSO and global-mean temperature (perhaps cross-correlation analysis would be useful); the importance of not extrapolating results from one timescale to another timescale; or the lack of trends in ENSO. That way, the current paper contributes to the peer-reviewed literature while also doing a service by highlighting the problems with McLean et al.

I think I tried to emphasize that this should be a teaching moment. Even more important given the time lapse.

>
> 3. In general, the current paper is sloppy and needs tightening. I don't think the lead author needs 10 pages of text to make the main points.
>
>

So over to you to generate the next draft.

Hi Tim, I know Keith is out of commission for a while (give him my regards when you see him), but someone needs to at least give some context to the latest McIntyre meme.

<http://planetgore.nationalreview.com/post/?q=Y2Q5ZGExZTc3ZTlmMTA5OTdhOGRjNzdINmU4N2M4ZTg=>

None of us at RC have any real idea what was done or why and so we are singularly unable to sensibly counter the flood of nonsense. Of course, most of the reaction is hugely overblown and mixed up but it would be helpful to have some kind of counterpoint to the main thrust. If you can point to someone else that could be helpful, please do!

Thanks

Gavin

Subject: Re: attacks against Keith

Date: Tue Sep 29 09:17:12 2009

Mike, Gavin,

As Tim has said Keith is making a good recovery and hopes to be back in soon, gradually during October and hopefully full time from November.

I talked to him by phone yesterday and sent him and Tom Melvin the threads on CA. As you're fully aware, trying to figure out what McIntyre has done is going to be difficult. It would be so much easier if they followed normal procedure and wrote up a comment and submitted it to a journal. I looked through the threads yesterday trying to make sense of what he's done. My suspicion is that he's brought in other tree ring series from more distant sites, some of which may not even be larch. There are two chronologies that have been used - one called the Polar Urals and one called Yamal. PU is a Schweingruber site with density as well as ring width. The PU reconstruction is therefore not a chronology, but a regression based reconstruction from both MXD and TRW. Yamal is just a ring width series (with lots of sub-fossil material, so much older) from an area some distance (at least 500km) north of PU. It was developed by Hantemirov and Shiyatov and was poorly standardized - corridor method. I also don't think McIntyre understands the RCS method even though he claims to have a program. The ends and the age structure of the samples are crucial in all this, but I think he just throws series in.

I totally agree that these attacks (for want of a better word) are getting worse. Comments on the thread are snide in the extreme, with many saying they see no need to submit the results to a journal. They have proved Keith has manipulated the data, so job done.

Hadn't thought of Senate debates. I'd put this down to the build up to Copenhagen, which is sort of the same.

[1]<http://wattsupwiththat.com/2009/09/24/a-look-at-the-thompson-et-al-paper-hi-tech-wiggle-matching-and-removal-of-natural-variables/>

is a complete reworking of Dave Thompson's paper which is in press in J. Climate (online). Looked at this, but they have made some wrong assumptions, but someone has put a lot of work into it.

[2]<http://wattsupwiththat.com/2009/09/24/ooops-dutch-meteorological-institute-caught-in-weather-station-siting-failure-moved-station-and-told-nobody/>

This one is a complete red herring - nothing wrong with De Bilt measurements. This is what it is about according to someone at KNMI

The issue you refer to is causing a lot of noise in the Netherlands (even MP's asking questions to the minister). It seems this is not at all about the observational series (nothing strange is going on), but more related to the "Law on KNMI" and the division of tasks between commercial providers and KNMI to be discussed by parliament soon.

Cheers

Phil

At 08:46 29/09/2009, Tim Osborn wrote:

Hi Mike and Gavin,

thanks for your emails re McIntyre, Yamal and Keith.

I'll pass on your best wishes for his recovery when I next speak to Keith. He's been off almost 4 months now and won't be back for at least another month (barring a couple of lectures that he's keen to do in October as part of a gradual return). Hopefully he'll be properly back in November.

Regarding Yamal, I'm afraid I know very little about the whole thing -- other than that I am 100% confident that "The tree ring data was hand-picked to get the desired result" is complete crap. Having one's integrity questioned like this must make your blood boil (as I'm sure you know, with both of you having been the target of numerous such attacks). Though it would be nice to shield Keith from this during his recovery, I think Keith will already have heard about this because he had recently been asked to look at CA in relation to the Kaufman threads (Keith was a co-author on that and Darrell had asked Keith to help with a response to the criticisms).

Apart from Keith, I think Tom Melvin here is the only person who could shed light on the McIntyre criticisms of Yamal. But he can be a rather loose cannon and shouldn't be directly contacted about this (also he wasn't involved in the Yamal chronology being discussed, though he has been involved in a regional reconstruction that we've recently been working towards that uses these -- and more -- data).

Perhaps Phil and I should talk with Tom and also see if Keith is already considering a response.

Off to lecture for a couple of hours now...

Cheers

Tim

Grant, Kevin,

Agree on the responses. It does just seem a case of removing a number of the adjectives. It is important to keep the moral high ground in this, if just to show how a comment on a paper should be written and submitted to the same journal that had the poor paper in the first instance. Might be worth reiterating this if any of us get called when the comment does come out. There does seem a trend these days to slam a paper on blogs with no attempt to submit a comment to a journal.

Agree on the running mean/derivative issue - the spectral diagram is better.

Scatter plots aren't that useful unless. They's might help with the (a) parts, but it's obvious from the time series plots and the r-squareds are so different!

Finally - there was this comment via Jim S from Neville Nicholls. I vaguely recall Angell and Korshover papers

from that time. The attached refers to some of them - also found Newell and Weare. This isn't the first, but it might be worth adding. Attached this one from Science as well.

Neville Nicholls wrote:

Hi Jim.

I hop things are going well with you.

Thanks for being part of this robust response to the latest silliness. You have certainly gathered an illustrious group of co-authors.

I am disappointed that you didnt cite the very early (1970s) work by Newell and Weare, and by Angell and Korshover. I think you should squeeze these in, to demonstrate that the climate community did not have to wait for McLean et al to understand the influence of ENSO on global temperatures. In fact, our colleagues in the 1970s understood this, and demonstrated it much more scientifically than does the McLean et al paper.

Cheers,

Neville

Cheers

At 21:45 28/09/2009, Kevin Trenberth wrote:

Hi all

About time. Incidentally i gave a copy to Mike McPhaden and discussed it with him last week when we were together at the OceanObs'09 conference. Mike is President of AGU.

Basically this is an acceptance with a couple of suggestions for extras, and some suggestions for toning down the rhetoric. I had already tried that a bit. My reaction is that the main thing is to expedite this. That means no extras unless it really makes sense. And removal of a few unnecessary words like "absolutely".

In the abstract, we have a number of such adjectives that could be removed: I agree with Rev 3 in this.

"greatly overstates" could be just "overstates" as it is reinforced better later.

"severely overestimates" could be just "overestimates"

"faulty analysis" maybe "flawed analysis"?

"extremely high" maybe "very high" or "unduly high"

I would leave last sentence alone though as the main comment.

A few more comments embedded below.

>
> This paper does an excellent job of showing the errors in the analytical methods used by McLean et al. and why their conclusions about the influence of ENSO on global air temperature is incorrect. I have only a couple of suggestions to help clarify their analysis of the methods. First, a little more explanation of the comment about the time derivative reduced to an additive constant would help. Second, in the analysis of the artificial time series I think it would be interesting to show the results of both steps of filtering (running mean and derivative) as separate time series. This would help the reader understand why the filtering creates false correlations. The only other suggestion is to find a better adjective than "faulty" in the abstract to characterize the analysis.

>

It is not so easy to see the result from the derivative owing to the phase shift. The spectrum actually does a better job. I would address this comment in this way and change "faulty".

>
> Reviewer #2 (Comments):

>
> I think this comment on McLean et al can be published more or less as is.

>
> I have two comments

>
> First, in the abstract (page 3, line 15), I'm not sure that "inflating" is quite the right verb - the paper itself does not make the point that the filter constructed by McLean et al inflates power in the 2-6 year window. Perhaps "isolating" would be a better verb.

Yes it should not be in abstract if not in text. Need to point out that the response function in Fig. 1 is greater than unity and does "inflate". So adjust the text.

>
> Secondly, I think the points that are being made with Figures 4 and 5 could be strengthened by adding to the right of each plot of a pair of time series, a scatter plot of the pairs of values available at each time. Such a scatter plot would help to clearly illustrate the absence (upper panels) or presence (lower panels) of correlation between red and black values.

I don't think this helps. There is nothing to be gained from a scatter plot that a correlation or regression value does not summarize.

- > Accept pending major changes (mainly in style not scientific comment)
- >
- > The real mystery here, of course, is how the McLean et al. paper ever made it into JGR. How that happened, I have no idea. I can't see it ever getting published through J Climate. The analyses in McLean et al. are among the worst I have seen in the climate literature. The paper is also a poorly guised attack on the integrity of the climate community, and I guess that is why Foster et al. have taken the energy to contradict its findings.

Agree, see above

- > - In the introduction... 'Unfortunately, their conclusions are seriously in error...' strikes me as overly subjective. Better to say: 'We will demonstrate that their conclusions are strongly dependent on' or something like that...

Don't go that far. Could drop "seriously" but they are "in error"

- > - Page X-6: 'tell us absolutely nothing'. Surely it's enough to state 'tell us nothing'.

agree

- > - Page X-9: 'it is misleading...' That's a strong word. It may be true. But I think we should rise above such accusations.

misleading is OK. I did a search (not sure I have latest) and found "grossly misleading" and the "grossly" could be removed.

- >
- > Anyway, I'm sure the lead author gets my point. I think the current paper will have a much greater impact (and can claim the high road) if it is rewritten in a more objective manner.

On Sep 29, 2009, at 5:08 PM, Michael Mann wrote:

Hi Andy,

I'm fairly certain Keith is out of contact right now recovering from an operation, and is not in a position to respond to these attacks. However, the preliminary information I have from others familiar with these data is that the attacks are bogus.

It is unclear that this particular series was used in any of our reconstructions (some of the underlying chronologies may be the same, but I'm fairly certain the versions of these data we have used are based on a different composite and standardization method), let alone any of the dozen other reconstructions of Northern Hemisphere mean temperature shown in the most recent IPCC report, which come to the conclusion that recent warming is anomalous in a long-term context.

So, even if there were a problem w/ these data, it wouldn't matter as far as the key conclusions regarding past warmth are concerned. But I don't think there is any problem with these data, rather it appears that McIntyre has greatly distorted the actual information content of these data. It will take folks a few days to get to the bottom of this, in Keith's absence.

if McIntyre had a legitimate point, he would submit a comment to the journal in question. of course, the last time he tried that (w/ our '98 article in Nature), his comment was rejected. For all of the noise and bluster about the Steig et al Antarctic warming, its now nearing a year and nothing has been submitted. So more likely he won't submit for peer-reviewed scrutiny, or if it does get his criticism "published" it will be in the discredited contrarian home journal "Energy and Environment". I'm sure you are aware that McIntyre and his ilk realize they no longer need to get their crap published in legitimate journals. All they have to do is put it up on their blog, and the contrarian noise machine kicks into gear, pretty soon Druge, Rush Limbaugh, Glenn Beck and their ilk (in this case, The Telegraph were already on it this morning) are parroting the claims. And based on what? some guy w/ no credentials, dubious connections with the energy industry, and who hasn't submitted his claims to the scrutiny of peer review.

Fortunately, the prestige press doesn't fall for this sort of stuff, right?

mike

Hi Andy,

Yep, what was written below is all me, but it was purely on background, please don't quote anything I said or attribute to me w/out checking specifically--thanks.

Re, your point at the end--you've taken the words out of my mouth. Skepticism is essential for the functioning of science. It yields an erratic path towards eventual truth. But legitimate scientific skepticism is exercised through formal scientific circles, in particular the peer review process. A necessary though not in general sufficient condition for taking a scientific criticism seriously is that it has passed through the legitimate scientific peer review process. those such as McIntyre who operate almost entirely outside of this system are not to be trusted.

mike

Cc: Gavin Schmidt <gschmidt@giss.nasa.gov>, Tim Osborn <t.osborn@uea.ac.uk>

Hi Phil,

lets not get into the topic of hate mail. I promise you I could fill your inbox w/ a very long list of vitriolic attacks, diatribes, and threats I've received.

Its part of the attack of the corporate-funded attack machine, i.e. its a direct and highly intended outcome of a highly orchestrated, heavily-funded corporate attack campaign. We saw it over the summer w/ the health insurance industry trying to defeat Obama's health plan, we'll see it now as the U.S. Senate moves on to focus on the cap & trade bill that passed congress this summer. It isn't coincidental that the original McIntyre and McKitrick E&E paper w/ press release came out the day before the U.S. senate was considering the McCain Lieberman climate bill in '05.

we're doing the best we can to expose this. I hope our Realclimate post goes some ways to exposing the campaign and pre-emptively deal w/ the continued onslaught we can expect over the next month.

thanks for alerting us to that detail of Kaufman et al which I'd overlooked. We'd already asked Darrell if he could compute a Yamal-less version of his series, but as you point out he's really already done this! And Osborn and Briffa '06 is also immune to this issue, as it eliminated any combination of up to 3 of the proxies and showed the result was essentially the same (fair to say this Tim?).

Also, is it fair to say that this particular version of Keith's Yamal series was not what we used in Mann and Jones '03 (we reference Briffa et al '01)?

thanks for the help! We're hoping to have something up tomorrow at the latest, and any updates at your end will be extremely helpful to the case,

mike

On Sep 30, 2009, at 10:30 AM, Phil Jones wrote:

Mike, Gavin,

The short note may not say much. As you're aware Kaufman et al have a plot without trees - their plots shows trees, lakes and ice separately.

Another issue is science by blog sites - and the then immediate response mode. Science ought to work through the peer-review system..... sure you've said all these things before.

We're getting a handful of nasty emails coming and requests for comments on other blog sites. One email has gone to the University Registrar because of the language used. Keith had one that said he was responsible for millions of deaths! Even one reading far too much into his off ill message.

Even though I've had loads of FOIs and nasty emails, a few in the last 2 days have been the worst yet. I'm realizing more what those working on animal experiments must have gone through.

Cheers

Phil

At 14:56 30/09/2009, Michael Mann wrote:

great--thanks Tim, sounds like we have a plan. in our post, which we'll target for tomorrow as well, we'll simply link to whatever CRU puts up and re-iterate the sentiment of the temporary short response (i.e. that there was no cherry-picking, a careful and defensible selection procedure was used) and we'll mostly focus on the broader issues, i.e. that any impact of this one series in the vast array of paleoclimate reconstructions (and the importance of the paleoclimate reconstructions themselves) has been over-stated, why these sorts of attacks are not legitimate science, etc.

mike

On Sep 30, 2009, at 9:51 AM, Gavin Schmidt wrote:

of course. we're preparing a 'bigger picture' response and will link directly to CRU and maybe quote from it directly.

Hi Tim,

Just checking if there are any further developments here, i.e. some more info from either Tom or Keith.

Gavin and I feel we need to do something on RealClimate on this quickly, probably by later today.

thanks in advance for any help you can offer,

mike

On Sep 29, 2009, at 3:46 AM, Tim Osborn wrote:

Hi Mike and Gavin,

thanks for your emails re McIntyre, Yamal and Keith.

I'll pass on your best wishes for his recovery when I next speak to Keith. He's been off almost 4 months now and won't be back for at least another month (barring a couple of lectures that he's keen to do in October as part of a gradual return). Hopefully he'll be properly back in November.

Regarding Yamal, I'm afraid I know very little about the whole thing -- other than that I am 100% confident that "The tree ring data was hand-picked to get the desired result" is complete crap. Having one's integrity questioned like this must make your blood boil (as I'm sure you know, with both of you having been the target of numerous such attacks). Though it would be nice to shield Keith from this during his recovery, I think Keith will already have heard about this because he had recently been asked to look at CA in relation to the Kaufman threads (Keith was a co-author on that and Darrell had asked Keith to help with a response to the criticisms).

Apart from Keith, I think Tom Melvin here is the only person who could shed light on the McIntyre criticisms of Yamal. But he can be a rather loose cannon and shouldn't be directly contacted about this (also he wasn't involved in the Yamal chronology being discussed, though he has been involved in a regional reconstruction that we've recently been working towards that uses these -- and more -- data).

Perhaps Phil and I should talk with Tom and also see if Keith is already considering a response.

Off to lecture for a couple of hours now...

Cheers

Tim

Mike,
I realized you'd have many more bad emails!
As for MJ2003 what we used was an average of Fennoscan, Yamal and Taymir (as one of the series).
Briffa et al (2001) was just referred to in that as a ref to RCS. The paper also talks about N Eurasia, so the sites get a mention.

At 16:06 30/09/2009, Michael Mann wrote:

Mike,

yes, you're right: figs S4-S6 in our supplementary information do indeed show results leaving out individual, groups of two, and groups of three proxies, respectively. It's attached.

I wouldn't say we were immune to the issue -- results are similar for these leave 1, 2 or 3 out cases, but they certainly are not as strong as the case with all 14 proxies. Certainly in figure S6, there are some cases with 3 omitted (i.e. some sets of 11) where modern results are comparable with intermittent periods between 800 and 1100.

Plus there is the additional uncertainty, discussed on the final page of the supplementary information, associated with linking the proxy records to real temperatures (remember we have no formal calibration, we're just counting proxies -- I'm still amazed that Science agreed to publish something where the main analysis only involves counting from 1 to 14! :-)).

But this is fine, since the IPCC AR4 and other assessments are not saying the evidence is 100% conclusive (or even 90% conclusive) but just "likely" that modern is warmer than MWP. So, yes, it should be possible to find some subsets of data where MWP and Modern are comparable and similarly for some seasons and regions. And as you've pointed out before, if any season/region is comparable (or even has MWP>Modern) then it will probably be the northern high latitudes in summer time (I think you published on this, suggesting that combination of orbital forcing, land-use change and sulphate aerosols could cause this for that season/region, is that right?).

So, this Yamal thing doesn't damage Osborn & Briffa (2006), but important to note that O&B (2006) and others support the "likely" statement rather than being conclusive.

Cheers

Tim

Mike, Gavin,

Here are a few important mods to your piece. Don't mention Keith has been off ill. Remove the bit about provenance and about access to more data. We'll go into the latter in the longer bit next week.

We'll send the piece we're putting up later - or give you the link.

Rest of your piece is great - especially the bit on how science should be done. Keith has also picked up in the bit we'll post that McIntyre has put in the caveats but lets others say the outrageous things in comments or on other blogs.

Cheers

Phil

Keith - is there a time in the next few days when you could stand talking briefly about this on the phone? I think the fog about the status of the Indigirka/Yakutua data could be cleared really quickly that way. Once again, I'm really sorry it has been necessary to bother you with this. Cheers, Malcolm

Malcolm,

Keith should be reading emails. Probably been a misunderstanding. I've only glanced at the nonsense but didn't see anything related to Indigirka. I see they are now getting at the Taimyr site, so Keith/Tom having to look at that one too.

They have some extra data from Vlad which CA won't have, so whatever they say there will get more emails about keeping hold of more data. All the issues seem to relate to canopy closed sites like Fritz would have likely sampled and more open sites. They are trying to contact the Russians to get site pictures or anything else.

Keith is on +44 1953 851013 if you fancy calling at the weekend.

They get at us for keeping hold of data, but they have no intention of publishing in the peer-review literature!

Cheers

Phil

Dear Keith - I do hope your recovery continues apace, in spite of the recent nonsense. I really have had no intention to bother you with work stuff, and had strongly encouraged Mike and Gavin to contact Tim and/or Tom putting a response on RICI. So, I'm really reticent to raise something else, but must.

What's going on? 21st September I got an email from Tom M that contained the following para, among other more general discussion:

"Keith has been complained at by Climate Audit for cherry picking and not using your long Indigirka River data set. Not used because we did not have the data. Please, could we have the data? We will make proper acknowledgement/coauthorship if we use the data." I replied pretty much straight away thus: "Hi Tom - please find the Esper article in question attached. The so-called Indigirka River data set is not yet available because it has not been published. I am currently working on that with Russian colleagues, and was indeed in Switzerland the week before last to work with one of them on specifically this. All being well, there will be an accepted manuscript before next summer, and at that point I will make the data freely available. Once we get to that point, I'll let you know, of course. Cheers, Malcolm" .

So far, no direct response to this email from Tom.

This morning I get an email from Anders Moberg, telling me that you had asked him for the "Indigirka data". I've waited a couple of hours before writing this email so as to try to be constructive. To be sure that you understand what that dataset is and is not, please read the attached 2006 Moberg corrigendum.

Once again, the actual data are unpublished, in spite of having been discussed in the Russian literature by Siderova et al. A large proportion of the raw data are not yet in the public domain, and so you would not be able to critically evaluate the chronology as a possible climate proxy. Why can that not be said - adequate metadata not available, please see Moberg corrigendum? By the way, a 600-year reconstruction is available (Hughes et al 1999, also attached), and all those raw data are at the ITRDB.

As you know, it is my intention to friendly, cooperative and open, but I'm determined to get some scientific value from all the years of work I've invested in the Yakutia work, and in cooperation with Russia in general. Releasing these data now would be too much. Cheers, Malcolm

Malcolm

honestly just a cross thread between Tom and I. I had been asked by Darrell whether we should use the Sidorova chronology - because of hassle by you know who - so asked Tom a while ago to ask you. I did not see your answer - sorry if you cc'd me in as I have not been checking emails. I fully accept and would NEVER go behind your back to ask for the data. I understood that the chronology was published and so thought to compare our RCS version with it if we could produce it in time . We are being accused of not using that chronology in the Science paper- so then asked Anders for it. I am happy to send Darrell the single chronology if that is what Anders has sent. I am having to start thinking about the Yamal crap and then this Darrell stuff suddenly arises. I just wanted him to consider including the Polar Urals reconstruction and the Sidorova series in his analysis before publishing a correction in Science- apparently the selection criterion for inclusion of series was anything published north of 60 degrees and longer than 1000 years. I could do without all this now - don't really understand what Climate Audit are getting so hysterical about but feel that I can not ignore it this time - but don't feel up to getting involved. I fully admit to being out of the loop as regards all this and having trouble getting back to it.

To restate - this was a confusion. I fully accept your point (as you know I would). Sorry if you thought I was doing anything without your knowledge - TO BE HONEST ALSO - I actually was not really aware that the data you were producing and that used by Sidorova were one and the same. Best wishes hopefully all ok

I assume that we are allowed to use the chronolgy as published - are we? I have not contacted Sidorova. Can you cc answer to Tom as I have no email at present. (this coming from someone elses computer)

thanks Phil,

I wondered where this completely false claim was coming with. Are these people really so clueless that they don't even understand that I have nothing to do with this whatsoever. Pretty much tells you everything you need to do.

I never acknowledge emails from people I don't know, about topics that are in any way sensitive. this is a perfect example of something that goes right to the trash bin,

mike

On Oct 5, 2009, at 5:55 AM, Phil Jones wrote:

Gavin, Mike,

Thanks for this!

I assume you are both aware of this prat - Neil Craig, see below. Keith won't be responding.

Checking facts doesn't seem important these days. As CA threads aren't publications this is difficult for non scientists.

I am going further over one email I got at the weekend - see also below. Typical of Sonia - although she now seems to only be an emeritus reader!

Cheers

Phil

Professor Briffa,

I have written a couple of blogs on the current report by Steve McIntyre that the data used by Mann to "prove" the hockey Stick was fabricated. This & the

following day's

[5]<http://a-place-to-stand.blogspot.com/2009/10/global-warming-proven-deliberate-fraud.html>

As a result I have received this email from somebody I am not acquainted with throwing the entire blame on you. This seems improbable to me & possibly an alarmist damage limitation exercise. If you wish to comment I would be happy for you to do so.

"Please note: Steve McIntyre's post concerns work by climate scientist Keith Briffa and not Michael Mann. You will probably wish to correct your post.

Cheers

Avisame"

I have posted this as an update with my reply:

"My understanding is that while Briffa did the tree ring measurement, Mann, in his paper, chose to choose 12 atypical tree rings out of at least 34 to fabricate the global warming trend. My assumption is that Mann is responsible for fabrications in his own paper & that this is a damage limitation exercise. I am open to correction on this & indeed have emailed Mr Briffa to see. "

Neil Craig

We received this through our enquiries desk. I assume that you are aware of this person, including those copied on the message.

If we are to respond, it would be to indicate that there are multiple sources of supporting evidence and that we continue to place our confidence in the international scientific assessment process. This confidence has proven to be well placed.

Subject: RE: Please take note of potetially serious allegations of scientific 'fraud' by CRU and Met Office

Dear Stephanie

I expect that a great deal of UKCIP work is based on the data provided by CRU (as does the work of the IPCC and of course UK climate policy). Some of this, very fundamentally, would now seem to be open to scientific challenge, and may even face future legal enquiries. It may be in the interest of UKCIP to inform itself in good time and become a little more 'uncertain' about its policy advice.

Perhaps you can comment on the following and pass the allegations made on to the relevant people.

It is beyond my expertise to assess the claims made, but they would fit into my perception of the whole 'man-made global warming' cum energy policy debate. I know several of the people involved personally and have no reason to doubt their sincerity and honour as scientists, though I am also aware of their highly critical (of IPCC science) policy positions.

I could also let you have statements by Steve McIntyre and Ross McKittrick. Ross McKittrick currently teaches at Westminster Business School and who is fully informed about the relevant issues. He recently addressed a meeting of about 50 people in London.

Best wishes

Tom,

Thanks for trying to clear the air with a few people. Keith is still working on a response. Having to contact the Russians to get some more site details takes time.

Several things in all this are ludicrous as you point out. Yamal is one site and isn't in most of the millennial reconstructions. It isn't in MBH, Crowley, Moberg etc. Also picking trees for a temperature response is not done either.

The other odd thing is that they seem to think that you can reconstruct the last millennium from a few proxies, yet you can't do this from a few instrumental series for the last 150 years! Instrumental data are perfect proxies, after all.

[1]http://www.americanthinker.com/2009/10/un_climate_reports_they_lie.html

This one is wrong as well. IPCC (1995) didn't use that silly curve that Chris Folland or Geoff Jenkins put together.

Cheers

Phil

At 02:59 05/10/2009, you wrote:

David,

This is entirely off the record, and I do not want this shared with anyone. I hope you will respect this. This issue is not my problem, and I await further developments.

However, Keith Briffa is in the Climatic Research Unit (CRU), and I was Director of CRU for many years so I am quite familiar with Keith and with his work. I have also done a lots of hands on tree ring work, both in the field and in developing and applying computer programs for climate reconstruction from tree rings. On the other hand, I have not been involved in any of this work since I left CRU in 1993 to move to NCAR. But I do think I can speak with some modicum of authority.

You say, re dendroclimatologists, "they rely on recent temperature data by which to *select* recent tree data" (my emphasis). I don't know where you get this idea, but I can assure you that it is entirely wrong.

Further, I do not know the basis for your claim that "Dendrochonology is a bankrupt approach". It is one of the few proxy data areas where rigorous multivariate statistical tools are used and where reconstructions are carefully tested on independent data.

Finally, the fact that scientists (in any field) do not willingly share their hard-earned primary data implies that they have something to hide has no logical basis.

Tom.

David Schnare wrote:

Tom:

Briffa has already made a preliminary response and he failed to explain his selection procedure. Further, he refused to give up the data for several years, and was forced to do so only when he submitted to a journal that demanded data archiving and actually enforced the practice.

More significantly, Briffa's analysis is irrelevant. Dendrochronology is a bankrupt approach. They admit that they cannot distinguish causal elements contributing to tree ring size. Further, they rely on recent temperature data by which to select recent tree data (excluding other data) and then turn around and claim that the tree ring data explains the recent temperature data. If you can give a principled and reasoned defense of Briffa (see the discussion on Watt's website) then go for it. I'd be fascinated, as would a rather large number of others.

None of this, of course, detracts for the need to do research on geoengineering. David Schnare

On Sun, Oct 4, 2009 at 8:50 PM, Tom Wigley <wigley@ucar.edu <mailto:wigley@ucar.edu>> wrote:

Dear all,

I think it would be wise to let Briffa respond to these accusations before compounding them with unwarranted extrapolations.

With regard to the Hockey Stick, it is highly unlikely that a single site can be very important. M&M have made similar accusations in the past and they have been shown, in the peer-reviewed literature, to be ill-founded.

Two recent papers you should read are those in the attached Word document (first pages only).

Tom.

Subject: [geo] Re: CCNet: A Scientific Scandal Unfolds

Gene:

I've been following this issue closely and this is what I take away from it:

1) Tree ring-based temperature reconstructions are fraught with so much uncertainty, they have no value whatever. It is impossible to tease out the relative contributions of rainfall, nutrients, temperature and access to sunlight. Indeed a single tree can, and apparently has, skewed the entire 20th century temperature reconstruction.

2) The IPCC peer review process is fundamentally flawed if a lead author is able to both disregard and ignore criticisms of his own work, where that work is the critical core of the chapter. It not only destroys the credibility of the core assumptions and data, it destroys the credibility of the larger work - in this case, the IPCC summary report and the underlying technical reports. It also destroys the utility and credibility of the modeling efforts that use assumptions on the relationship of CO2 to temperature that are based on Britta's work, which is, of course, the majority of such analyses.

As Corcoran points out, "the IPCC has depended on 1) computer models, 2) data collection, 3) long-range temperature forecasting and 4) communication. None of these efforts are sitting on firm ground."

Nonetheless, and even if the UNEP thinks it appropriate to rely on Wikipedia as their scientific source of choice, greenhouse gases may (at an ever diminishing probability) cause a significant increase in global temperature. Thus, research, including field trials, on the leading geoengineering techniques are appropriate as a backstop in case our children find out that the current alarmism is justified.

Alan:

Thanks for the extensive and detailed e-mail. This is terrible but not surprising. Obviously I do not know what gives with these guys. However, I have my own suspicions and hypothesis. I dont think they are scientifically inadequate or stupid. I think they are dishonest and members of a club that has much to gain by practicing and perpetuating global warming scare tactics. That is not to say that global warming is not occurring to some extent since it would be even without CO2 emissions. The CO2 emissions only accelerate the warming and there are other factors controlling climate. As a result, the entire process may

be going slower than the powers that be would like. Hence, (I postulate) the global warming contingent has substantial motivation to be dishonest or seriously biased, and to be loyal to their equally dishonest club members. Among the motivations are increased and continued grant funding, university advancement, job advancement, profits and payoffs from carbon control advocates such as Gore, being in the limelight, and other motivating factors I am too inexperienced to identify.

Alan, this is nothing new. You and I experienced similar behavior from some of our colleagues down the hall, the Bell Labs research people, in the good old days. Humans are hardly perfect creations. I am never surprised at what they can do. I am perpetually grateful for those who are honest and fair and thankfully there is a goodly share of those.

Subject: CCNet: A Scientific Scandal Unfolds

CCNet 153/2009 - 2 October 2009 -- Audiatur et altera pars
CRU'S HIDDEN DATA AND THE IPCC: A SCIENTIFIC SCANDAL UNFOLDS

A scientific scandal is casting a shadow over a number of recent peer-reviewed climate papers. The scandal has serious implications for public trust in science. The IPCC's mission is to reflect the science, not create it. As the IPCC states, its duty is "assessing the scientific, technical and socioeconomic information relevant for the understanding of the risk of human-induced climate change. It does not carry out new research nor does it monitor climate-related data." But as IPCC lead author, Briffa was a key contributor in shaping the assessment. When the IPCC was alerted to peer-reviewed research that refuted the idea, it declined to include it. This leads to the more

general, and more serious issue: what happens when peer-review fails -

as it did here?

--Andrew Orłowski, The Register, 29 September 2009

Over the next nine years, at least one paper per year appeared in prominent journals using Briffa's Yamal composite to support a hockey

stick-like result. The IPCC relied on these studies to defend the Hockey

Stick view, and since it had appointed Briffa himself to be the IPCC

Lead Author for this topic, there was no chance it would

question the

Yamal data. Despite the fact that these papers appeared in top journals

like Nature and Science, none of the journal reviewers or editors ever

required Briffa to release his Yamal data. Steve McIntyre's repeated requests for them to uphold their own data disclosure rules were ignored.

--Ross McKittrick, Financial Post, 1 October 2009

The official United Nation's global warming agency, the Intergovernmental Panel on Climate Change, is a four-legged stool that

is fast losing its legs. To carry the message of man-made global warming theory to the world, the IPCC has depended on 1) computer models, 2) data collection, 3) long-range temperature forecasting and 4)

communication. None of these efforts are sitting on firm ground.

--Terence Corcoran, National Post, 1 October 2009

Media reaction to the Yamal story has been rather limited so far. I'm

not sure whether this is because people are trying to digest what it means or whether it's "too hot to handle". None of the global warming

supporters in the mainstream media have gone near it. The reaction of

the Guardian - to delete any mention of the affair from their comment

threads - has been extraordinary.

--Bishop Hill, 1 October 2009

Britain will have to stop building airports, switch to electric cars and

shut down coal-fired power stations as part of a 'planned recession' to

avoid dangerous climate change. A new report from the Tyndall Centre for

Climate Change Research says the only way to avoid going beyond the dangerous tipping point is to double the target to 70 per cent by 2020.

This would mean reducing the size of the economy through a "planned recession".

--Louise Gray, The Daily Telegraph, 30 September 2009

Tokyo governor Shintaro Ishihara warned on Wednesday the 2016

Olympics

could be the last Games, with global warming an immediate threat to mankind. "It could be that the 2016 Games are the last Olympics in the history of mankind," Ishihara told reporters at a Tokyo 2016 press event ahead of the vote. "Global warming is getting worse. We have to come up with measures without which Olympic Games could not last long. "Scientists have said we have passed the point of no return," said Ishihara.

(1) TREEMOMETERS: A NEW SCIENTIFIC SCANDAL

The Register, 29 September 2009

<[32]http://www.theregister.co.uk/2009/09/29/yamal_scandal/>

By Andrew Orlowski

A scientific scandal is casting a shadow over a number of recent peer-reviewed climate papers.

At least eight papers purporting to reconstruct the historical temperature record times may need to be revisited, with significant implications for contemporary climate studies, the basis of the IPCC's

assessments. A number of these involve senior climatologists at the British climate research centre CRU at the University East Anglia. In

every case, peer review failed to pick up the errors.

At issue is the use of tree rings as a temperature proxy, or dendrochronology. Using statistical techniques, researchers take the ring data to create a "reconstruction" of historical temperature anomalies. But trees are a highly controversial indicator of temperature, since the rings principally record Co2, and also record humidity, rainfall, nutrient intake and other local factors.

Picking a temperature signal out of all this noise is problematic, and a

dendrochronology can differ significantly from instrumented data. In dendro jargon, this disparity is called "divergence". The process of creating a raw data set also involves a selective use of samples - a choice open to a scientist's biases.

Yet none of this has stopped paleoclimatologists from making bold claims using tree ring data.

In particular, since 2000, a large number of peer-reviewed climate papers have incorporated data from trees at the Yamal Peninsula in Siberia. This dataset gained favour, curiously superseding a newer and

larger data set from nearby. The older Yamal trees indicated pronounced

and dramatic uptick in temperatures.

How could this be? Scientists have ensured much of the measurement data

used in the reconstructions remains a secret - failing to fulfill procedures to archive the raw data. Without the raw data, other scientists could not reproduce the results. The most prestigious peer

reviewed journals, including Nature and Science, were reluctant to demand the data from contributors. Until now, that is.

At the insistence of editors of the Royal Society's Philosophical Transactions B the data has leaked into the open - and Yamal's mystery

is no more.

>From this we know that the Yamal data set uses just 12 trees from a

larger set to produce its dramatic recent trend. Yet many more were cored, and a larger data set (of 34) from the vicinity shows no dramatic

recent warming, and warmer temperatures in the middle ages.

In all there are 252 cores in the CRU Yamal data set, of which

ten were
alive 1990. All 12 cores selected show strong growth since the
mid-19th
century. The implication is clear: the dozen were cherry-picked.
Controversy has been raging since 1995, when an explosive paper
by Keith
Briffa at the Climate Research Unit at the University of East Anglia
asserted that that the medieval warm period was actually really
cold,
and recent warming is unusually warm. Both archaeology and the
historical accounts, Briffa was declaring, were bunk. Briffa
relied on
just three cores from Siberia to demonstrate this.
Three years later Nature published a paper by Mann, Bradley and
Hughes
based on temperature reconstructions which showed something similar:
warmer now, cooler then. With Briffa and Mann as chapter editors
of the
UN's Intergovernmental Panel on Climate Change (IPCC), this
distinctive
pattern became emblematic - the "Logo of Global Warming".
IPCC's Assessment Report from 2001 - with the error bars in grey
emphasised
Hokey hockey sticks
Mann too used dendrochronology to chill temperatures, and rebuffed
attempts to publish his measurement data. Initially he said he had
forgotten where he put it, then declined to disclosed it. (Some of
Mann's data was eventually discovered, by accident, on his ftp
server in
a directory entitled 'BACKTO_1400-CENSORED'.)
Tree data was secondary in importance to Mann's statistical
technique,
which would produce a dramatic modern upturn in temperatures - which
became nicknamed the "Hockey Stick" - even using red noise.
Similarly, all the papers that used the Yamal data have the same
point
to make. All suggest recent dramatic warming. Having scored a
global hit
with a combination of flawed statistics and dubious
dendrochronology,
the acts repeated the formula.
"Late 20th century warmth is unprecedented for at least roughly
the past
two millennia for the Northern Hemisphere," wrote the two authors of
Global Surface Temperatures over the Past Two Millennia published in
Geophysical Research Letters in 2003 - Mann, and Phil Jones of CRU.
For example, Briffa's 2008 paper concludes that: "The extent of
recent
widespread warming across northwest Eurasia, with respect to 100- to
200-year trends, is unprecedented in the last 2000 years."
The same authors in 2004:
It continues to this day. A study purporting to show the Arctic was
warmer now than for 2,000 years received front-page attention last

month. Led by Northern Arizona University professor Darrell S Kaufman,

and including dendro veteran Mann, this too relied heavily on Yamal, and produced the signature shape.

Now here's Yamal.

And when Yamal is plotted against the wider range of cores, the implications of the choice is striking:

A comparison of Yamal RCS chronologies. red - as archived with 12 picked

cores; black - including Schweingruber's Khadyta River, Yamal (russ035w)

archive and excluding 12 picked cores. Both smoothed with 21-year gaussian smooth. y-axis is in dimensionless chronology units centered on

1 (as are subsequent graphs (but represent age-adjusted ring width).

"The majority of these trees (like the Graybill bristlecones) have a prolonged growth pulse (for whatever reason) starting in the 19th century," wrote Canadian mathematician Steve McIntyre on his blog on Sunday. "When a one-size fits all age profile is applied to these particular tries, the relatively vigorous growth becomes monster growth

- 8 sigma anomalies in some of them."

McIntyre's determination to reproduce the reconstructions has resulted

in the Yamal data finally coming to light.

All the papers come from a small but closely knit of scientists who mutually support each other's work. All use Yamal data.

What went wrong?

The scandal has serious implications for public trust in science. The

IPCC's mission is to reflect the science, not create it.

As the panel states, its duty is "assessing the scientific, technical

and socioeconomic information relevant for the understanding of the risk

of human-induced climate change. It does not carry out new research nor

does it monitor climate-related data." But as lead author,

Briffa was a

key contributor in shaping (no pun intended) the assessment.

When the IPCC was alerted to peer-reviewed research that refuted the idea, it declined to include it. This leads to the more general, and more serious issue: what happens when peer-review fails - as it did here?

The scandal has only come to light because of the dogged persistence of

a Canadian mathematician who attempted to reproduce the results.

Steve

McIntyre has written dozens of letters requesting the data and methodology, and over 7,000 blog posts. Yet Yamal has remained elusive

for almost a decade. (r)

Bootnote

The Royal Society's motto from the enlightenment era is Nullius in verba. "On nobody's authority" or colloquially, "take nobody's word for it". In 2007, the Society's then president suggested this be changed to

"respect the facts".

(2) ANALYSIS: DEFECTS IN KEY CLIMATE DATA ARE UNCOVERED

Financial Post, 1 October 2009

<[33]http://network.nationalpost.com/np/blogs/fpcomment/archive/2009/10/01/ross-mckitrick-defects-in-key-climate-data-are-uncovered.aspx>

By Ross McKittrick

Beginning in 2003, I worked with Stephen McIntyre to replicate a famous

result in paleoclimatology known as the Hockey Stick graph.

Developed by

a U.S. climatologist named Michael Mann, it was a statistical compilation of tree ring data supposedly proving that air temperatures

had been stable for 900 years, then soared off the charts in the 20th

century. Prior to the publication of the Hockey Stick, scientists had

held that the medieval-era was warmer than the present, making the scale

of 20th century global warming seem relatively unimportant. The dramatic

revision to this view occasioned by the Hockey Stick's publication made

it the poster child of the global warming movement. It was featured prominently in a 2001 report of the U.N. Intergovernmental Panel on Climate Change (IPCC), as well as government websites and countless review reports.

Steve and I showed that the mathematics behind the Mann Hockey Stick were badly flawed, such that its shape was determined by suspect bristlecone tree ring data. Controversies quickly piled up: Two expert

panels involving the U.S. National Academy of Sciences were asked to investigate, the U.S. Congress held a hearing, and the media followed

the story around the world.

The expert reports upheld all of our criticisms of the Mann Hockey Stick, both of the mathematics and of its reliance on flawed bristlecone

pine data. One of the panels, however, argued that while the Mann Hockey

Stick itself was flawed, a series of other studies published since 1998

had similar shapes, thus providing support for the view that the late

20th century is unusually warm. The IPCC also made this argument in its 2007 report. But the second expert panel, led by statistician Edward Wegman, pointed out that the other studies are not independent. They are written by the same small circle of authors, only the names are in different orders, and they reuse the same few data climate proxy series over and over. Most of the proxy data does not show anything unusual about the 20th century. But two data series have reappeared over and over that do have a hockey stick shape. One was the flawed bristlecone data that the National Academy of Sciences panel said should not be used, so the studies using it can be set aside. The second was a tree ring curve from the Yamal Peninsula in Siberia, compiled by UK scientist Keith Briffa. Briffa had published a paper in 1995 claiming that the medieval period actually contained the coldest year of the millennium. But this claim depended on just three tree ring records (called cores) from the Polar Urals. Later, a colleague of his named F. H. Schweingruber produced a much larger sample from the Polar Urals, but it told a very different story: The medieval era was actually quite warm and the late 20th century was unexceptional. Briffa and Schweingruber never published those data, instead they dropped the Polar Urals altogether from their climate reconstruction papers. In its place they used a new series that Briffa had calculated from tree ring data from the nearby Yamal Peninsula that had a pronounced Hockey Stick shape: relatively flat for 900 years then sharply rising in the 20th century. This Yamal series was a composite of an undisclosed number of individual tree cores. In order to check the steps involved in producing the composite, it would be necessary to have the individual tree ring measurements themselves. But Briffa didn't release his raw data. Over the next nine years, at least one paper per year appeared in prominent journals using Briffa's Yamal composite to support a hockey stick-like result. The IPCC relied on these studies to defend the Hockey Stick view, and since it had appointed Briffa himself to be the IPCC Lead Author for this topic, there was no chance it would

question the

Yamal data.

Despite the fact that these papers appeared in top journals like

Nature

and Science, none of the journal reviewers or editors ever required

Briffa to release his Yamal data. Steve McIntyre's repeated

requests for

them to uphold their own data disclosure rules were ignored.

Then in 2008 Briffa, Schweingruber and some colleagues published

a paper

using the Yamal series (again) in a journal called the Philosophical

Transactions of the Royal Society, which has very strict

data-sharing

rules. Steve sent in his customary request for the data, and

this time

an editor stepped up to the plate, ordering the authors to

release their

data. A short while ago the data appeared on the Internet. Steve

could

finally begin to unpack the Yamal composite.

It turns out that many of the samples were taken from dead

(partially

fossilized) trees and they have no particular trend. The sharp

uptrend

in the late 20th century came from cores of 10 living trees

alive as of

1990, and five living trees alive as of 1995. Based on scientific

standards, this is too small a sample on which to produce a

publication-grade proxy composite. The 18th and 19th century

portion of

the sample, for instance, contains at least 30 trees per year.

But that

portion doesn't show a warming spike. The only segment that does

is the

late 20th century, where the sample size collapses. Once again a

dramatic hockey stick shape turns out to depend on the least

reliable

portion of a dataset.

But an even more disquieting discovery soon came to light. Steve

searched a paleoclimate data archive to see if there were other tree

ring cores from at or near the Yamal site that could have been

used to

increase the sample size. He quickly found a large set of 34

up-to-date

core samples, taken from living trees in Yamal by none other than

Schweingruber himself! Had these been added to Briffa's small

group the

20th century would simply be flat. It would appear completely

unexceptional compared to the rest of the millennium.

Combining data from different samples would not have been an unusual

step. Briffa added data from another Schweingruber site to a

different

composite, from the Taimyr Peninsula. The additional data were

gathered

more than 400 km away from the primary site. And in that case the primary site had three or four times as many cores to begin with as the

Yamal site. Why did he not fill out the Yamal data with the readily-available data from his own coauthor? Why did Briffa seek out

additional data for the already well-represented Taimyr site and not for the inadequate Yamal site?

Thus the key ingredient in most of the studies that have been invoked to

support the Hockey Stick, namely the Briffa Yamal series, depends on the

influence of a woefully thin subsample of trees and the exclusion of readily-available data for the same area. Whatever is going on here, it is not science.

I have been probing the arguments for global warming for well over a decade. In collaboration with a lot of excellent coauthors I have consistently found that when the layers get peeled back, what lies at

the core is either flawed, misleading or simply non-existent. The surface temperature data is a contaminated mess with a significant warm

bias, and as I have detailed elsewhere the IPCC fabricated evidence in

its 2007 report to cover up the problem. Climate models are in gross disagreement with observations, and the discrepancy is growing with each

passing year. The often-hyped claim that the modern climate has departed

from natural variability depended on flawed statistical methods and low-quality data. The IPCC review process, of which I was a member last

time, is nothing at all like what the public has been told:

Conflicts of

interest are endemic, critical evidence is systematically ignored and

there are no effective checks and balances against bias or distortion.

I get exasperated with fellow academics, and others who ought to know

better, who pile on to the supposed global warming consensus without bothering to investigate any of the glaring scientific discrepancies and

procedural flaws. Over the coming few years, as the costs of global warming policies mount and the evidence of a crisis continues to collapse, perhaps it will become socially permissible for people to start thinking for themselves again. In the meantime I am grateful for

those few independent thinkers, like Steve McIntyre, who continue to ask

the right questions and insist on scientific standards of
openness and
transparency.

Ross McKittrick is a professor of environmental economics at the
University of Guelph, and coauthor of Taken By Storm: The Troubled
Science, Policy and Politics of Global Warming.

(3) OPINION: CLIMATE DATA BUSTER
National Post, 1 October 2009

<[38]<http://network.nationalpost.com/np/blogs/fullcomment/archive/2009/10/01/terence-corcoran-climate-data-buster.aspx>>

By Terence Corcoran

The official United Nation's global warming agency, the
Intergovernmental Panel on Climate Change, is a four-legged
stool that

is fast losing its legs. To carry the message of man-made global
warming theory to the world, the IPCC has depended on 1) computer
models, 2) data collection, 3) long-range temperature
forecasting and 4)

communication. None of these efforts are sitting on firm ground.

Over the past month, one of the IPCC's top climate scientists, Mojib
Latif, attempted to explain that even if global temperatures were to
cool over the next 10 to 20 years, that would not mean that man-made
global warming is no longer catastrophic. It was a tough case to
make,

and it is not clear Mr. Latif succeeded. In a presentation to a
world

climate conference in early September, Mr. Latif rambled
somewhat and

veered off into inscrutable language that is now embedded in a
million

blog posts attempting to prove one thing or another.

A sample: "It may well happen that you enter a decade, or maybe even
two, you know, when the temperature cools, all right, relative
to the

present level...And then, you know, I know what's going to
happen. You

know, I will get, you know, millions of phone calls, you know
-'What's

going on?' 'So is global warming disappearing, you know?' 'Have

you lied
on us, you know?' So, and, therefore, this is the reason why we
need to
address this decadal prediction issue."
The decadal prediction issue appears to be a combination of computer
model problems, the unpredictability of natural climate
variation, and
assorted uncertainties. Making all this clear to the average global
citizen will not be easy and climate scientists need to be able
to make
it clear, said Mr. Latif. "We have to ask the nasty questions
ourselves,
all right, or some other people will do it."
All this is still swirling around the global climate issue
today. But
now along comes another problem. Canadian data buster Steve
McIntyre has
spend most of the last three years deconstructing the IPCC's famous
claim that the last couple of decades of the 20th century were the
hottest in a thousand years. Using what was called The Hockey Stick
graph, the IPCC claimed to have the smoking gun that showed a
sharp run
up in global temperatures through to 1997. The validity of the
IPCC data
began to crumble when Mr. McIntyre and Ross McKittrick of Guelph
University found serious data problems that raised doubts about the
graph and the claims of record high temperatures.
As Ross McKittrick explains in his op-ed, Steve McIntyre has
uncovered
another data distortion that further undermines the original graphic
claim that the world has set temperature records in recent years. If
world temperatures may have been just as hot in the past as they
have
been recently, and if the the next two decades could be cooler
than they
have been recently, the theory of climate change becomes an even
tougher
case to make.
The IPCC is now on wobbly legs at all four corners. Its models are
inadequate and need overhaul, data integrity is at issue, the
climate is
not quite following the script, and the communication program
for the
whole campaign is a growing struggle.

(4) OPINION: COOLING DOWN THE CASSANDRAS
The Washington Post, 1 October 2009

<[39]<http://www.washingtonpost.com/wp-dyn/content/article/2009/09/30/AR20090-93003569.html>>

By George F. Will

"Plateau in Temperatures Adds Difficulty to Task Of Reaching a

Solution"

--New York Times, Sept. 23

In this headline on a New York Times story about the difficulties confronting people alarmed about global warming, note the word "plateau." It dismisses the unpleasant -- to some people -- fact that

global warming is maddeningly (to the same people) slow to vindicate their apocalyptic warnings about it.

The "difficulty" -- the "intricate challenge," the Times says -- is "building momentum" for carbon reduction "when global temperatures have been relatively stable for a decade and may even drop in the next few

years." That was in the Times's first paragraph.

In the fifth paragraph, a "few years" became "the next decade or so,"

according to Mojib Latif, a German "prize-winning climate and ocean scientist" who campaigns constantly to promote policies combating global warming. Actually, Latif has said he anticipates "maybe even two" decades in which temperatures cool. But stay with the Times's "decade or so."

By asserting that the absence of significant warming since 1998 is a mere "plateau," not warming's apogee, the Times assures readers who are

alarmed about climate change that the paper knows the future and that

warming will continue: Do not despair, bad news will resume.

The Times reported that "scientists" -- all of them? -- say the 11 years

of temperature stability has "no bearing," none, on long-term warming.

Some scientists say "cool stretches are inevitable." Others say there

may be growth of Arctic sea ice, but the growth will be "temporary."

According to the Times, however, "scientists" say that "trying to communicate such scientific nuances to the public -- and to policymakers

-- can be frustrating."

The Times says "a short-term trend gives ammunition to skeptics of climate change." Actually, what makes skeptics skeptical is the accumulating evidence that theories predicting catastrophe from man-made

climate change are impervious to evidence. The theories are unfalsifiable, at least in the "short run." And the "short run" is defined as however many decades must pass until the evidence begins to

fit the hypotheses.

The Post recently reported the theory of a University of Virginia professor emeritus who thinks that, many millennia ago, primitive agriculture -- burning forests, creating methane-emitting rice paddies,

etc. -- produced enough greenhouse gases to warm the planet at least a degree. The theory is interesting. Even more interesting is the reaction to it by people such as the Columbia University professor who says it makes him "really upset" because it might encourage opponents of legislation combating global warming. Warnings about cataclysmic warming increase in stridency as evidence of warming becomes more elusive. A recent report from the United Nations Environment Program predicts an enormous 6.3 degrees Fahrenheit increase by the end of the century even if nations fulfill their most ambitious pledges concerning reduction of carbon emissions. The U.S. goal is an 80 percent reduction by 2050. But Steven Hayward of the American Enterprise Institute says that would require reducing greenhouse gas emissions to the 1910 level. On a per capita basis, it would mean emissions approximately equal to those in 1875. That will not happen. So, we are doomed. So, why try? America needs a national commission appointed to assess the evidence about climate change. Alarmists will fight this because the first casualty would be the carefully cultivated and media-reinforced myth of consensus -- the bald assertion that no reputable scientist doubts the gravity of the crisis, doubts being conclusive evidence of disreputable motives or intellectual qualifications. The president, however, could support such a commission because he is sure "there's finally widespread recognition of the urgency of the challenge before us." So he announced last week at the U.N. climate change summit, where he said the threat is so "serious" and "urgent" that unless all nations act "boldly, swiftly and together" -- "time . . . is running out" -- we risk "irreversible catastrophe." Prince Charles agrees. In March, seven months ago, he said humanity had 100 months -- until July 2017 -- to prevent "catastrophic climate change and the unimaginable horrors that this would bring." Evidently humanity will prevent this. Charles Moore of the Spectator notes that in July, the prince said that

by 2050 the planet will be imperiled by the existence of 9 billion people, a large portion of them consuming as much as Western people now do. Environmental Cassandras must be careful with their predictions lest they commit what climate alarmists consider the unpardonable faux pas of denying that the world is coming to an end.

(5) U.S. THROWS SPANNER INTO CLIMATE TALKS

Times of India, 2 October 2009

<[40]http://timesofindia.indiatimes.com/news/environment/global-warming/US-trows-spanner-into-climate-talks/articleshow/5079332.cms>

Nitin Sethi, TNN

NEW DELHI: The promise of a deal at Copenhagen seem to be turning into a

pipedream as the US has refused to put down hard numbers for mitigation

under the second phase of Kyoto Protocol at the ongoing climate negotiations at Bangkok. EU too seems to be taking a deal-breaking condition saying, "environmental integrity" was central to the UN treaty

and "equity" of different countries' rights was just one element.

The negotiations at various levels seem to be grinding into a logjam with US determined not to sign on to the Kyoto Protocol. The US negotiators fought hard at different forums within the UN talks to block

any progress on industrialized countries' commitments to reduce emissions in the mid-term under the second phase of Kyoto Protocol.

India stood steadfast in demanding that the rich countries put up their

offers in terms of hard numbers for emission reductions over 2012-2020

under the existing protocol. But, US and many other developed countries

seemed determined to do away with the Kyoto Protocol entirely.

This is not the first time that US has voiced its opposition to the Kyoto Protocol which demands quantified targets from rich countries. US

had not signed on to Kyoto earlier and it continues to oppose the only

tool the global treaty has for making measurable and comparable reductions in the dangerous greenhouse gases.

The protocol is also seen by a select band of industrialized countries

such as US and Japan as a wall of differentiation constructed in the convention. The parent treaty -- UN Framework Convention on Climate Change -- lays most of the burden of mitigation on the industrialized

countries that caused it in the first place. The Kyoto Protocol activates this principle of burden sharing into hard actions and

targets. The protocol in its first phase sets fixed percentages by which countries reduce their emissions by 2012 below 1990 levels. Many of the industrialized countries have not moved on a trajectory to achieve the targets for 2012. Part of the discussions in the UN talks have been to set a higher level targets for the second phase of Kyoto Protocol between 2012-2020. But the US, not keen to take on any commitments in the mid-term, has always shown interest in disbanding with Kyoto Protocol and instead taking on a series of actions that are decided by countries on their own -- say energy efficiency targets -- and merely presented to the UN forum. India and developing countries have pointed out that would make the targets incomparable and render it impossible to figure out if any significant reductions have been made in emissions to prevent a climate calamity. Other industrialized countries too have so far shown little interest in offering credible and robust targets for the second phase of the protocol. The offers so far on the table from the industrialized countries, if implemented, would only bring in reductions in the range of 11-18% by 2020 below 1990 levels. India and other developing countries have demanded that the industrialized countries follow the recommendations of the UN climate science panel -- IPCC -- and take cuts in the range of 25-40% below 1990 levels by 2020 which would put the world on a trajectory to avoid temperatures reaching dangerous levels in the decades to come.

(6) CAP AND TRADE MAY SINK OPPOSITION LEADER DOWN UNDER
The Australian, 2 October 2009

<[41]http://www.theaustralian.news.com.au/story/0,25197,26153820-2702,00.htm> l>

Lenore Taylor, National correspondent | October 02, 2009
MALCOLM Turnbull is on a collision course with his own back bench after staking his leadership on a demand that they back his climate change strategy. Several MPs immediately refused to do so. If the partyroom refused to back his strategy of negotiating amendments to the government's emissions trading scheme, Mr Turnbull said yesterday, the Coalition would "literally be a party with nothing to say ... a party with no ideas", and that was "not the party I am

prepared to
lead".

Throwing down the gauntlet to his internal critics, Mr Turnbull
said: "I

am asserting my authority as the leader of the Liberal Party and the
Leader of the Opposition."

"If the partyroom were to reject my recommendation to them, that
would

obviously be a leadership issue. That's perfectly plain, perfectly
clear," he told ABC Radio in Adelaide.

"I could not possibly lead a party that was on a
do-nothing-on-climate-change platform."

His critics were not cowed, despite the fact that both mooted
leadership

alternatives -- Joe Hockey and Tony Abbott -- support Mr Turnbull's
stance.

West Australian backbencher Wilson Tuckey said: "Mr Turnbull has
made

the ETS a leadership issue and we will now treat it as such." His
leader's ultimatum did not alter his "total opposition to an ETS
and to

the suggestion that we might amend it".

Victorian Liberal senator Julian McGauran said he stood by his
vow to

vote against the ETS in November, no matter what amendments were
negotiated.

Nationals senators also remain implacably opposed to the scheme. "He
hasn't got the partyroom with him on this one ... we are going
to stand

up for what we believe in," said senator Ron Boswell.

"This is not just another issue. This is not one we can let go
through

to the keeper," said senator Barnaby Joyce.

Mr Tuckey appeared to suggest Mr Turnbull's deputy, Julie
Bishop, as an

alternative leader, saying there were "many good potential
leaders in

the Liberal Party ... and perhaps some people who have had their
reputations tarnished by backgrounding from our side now deserve
reconsideration for the top job".

(7) THE MET OFFICE AND CRU'S YAMAL SCANDAL: EXPLAIN OR RESIGN

Jennifer Marohasy <jennifermarohasy@jennifermarohasy.com

<[43]mailto:jennifermarohasy@jennifermarohasy.com>

<[44]mailto:jennifermarohasy@jennifermarohasy.com>

<[45]mailto:jennifermarohasy@jennifermarohasy.com>>>

Leading UK Climate Scientists Must Explain or Resign, Jennifer
Marohasy

<[46]http://jennifermarohasy.com/blog/2009/09/leading-uk-climate-scientists->

must-explain-or-resign/>

MOST scientific sceptics have been dismissive of the various reconstructions of temperature which suggest 1998 is the warmest year of the past millennium. Our case has been significantly bolstered over the last week with statistician Steve McIntyre finally getting access to data used by Keith Briffa, Tim Osborn and Phil Jones to support the idea that there has been an unprecedented upswing in temperatures over the last hundred years - the infamous hockey stick graph. Mr McIntyre's analysis of the data - which he had been asking for since 2003 - suggests that scientists at the Climate Research Unit of the United Kingdom's Bureau of Meteorology have been using only a small subset of the available data to make their claims that recent years have been the hottest of the last millennium. When the entire data set is used, Mr McIntyre claims that the hockey stick shape disappears completely. [1]

Mr McIntyre has previously showed problems with the mathematics behind the 'hockey stick'. But scientists at the Climate Research Centre, in particular Dr Briffa, have continuously republished claiming the upswing in temperatures over the last 100 years is real and not an artifact of the methodology used - as claimed by Mr McIntyre. However, these same scientists have denied Mr McIntyre access to all the data. Recently they were forced to make more data available to Mr McIntyre after they published in the Philosophical Transactions of the Royal Society - a journal which unlike Nature and Science has strict policies on data archiving which it enforces. This week's claims by Steve McIntyre that scientists associated with the UK Meteorology Bureau have been less than diligent are serious and suggest some of the most defended building blocks of the case for anthropogenic global warming are based on the indefensible when the methodology is laid bare.

This sorry saga also raises issues associated with how data is archived at the UK Meteorological Bureau with in complete data sets that spuriously support the case for global warming being promoted while complete data sets are kept hidden from the public - including from scientific sceptics like Steve McIntyre.

It is indeed time leading scientists at the Climate Research Centre associated with the UK Meteorological Bureau explain how Mr McIntyre is

in error or resign.

(8) COOLING?

Rodney Chilton <maberrd@hotmail.com <mailto:maberrd@hotmail.com>

<[48]mailto:maberrd@hotmail.com <mailto:maberrd@hotmail.com>>>

Dear Benny:

Recently, there has been considerable discussion concerning the
slight

cooling of the earth's overall climate since about 2005. The
result of

the cooling has brought some scientists into the forefront to be
openly

critical of the still prominent view that climate changes over the
century or so have predominately been man caused. The proponents of
human initiated climate changes are of the opinion that the recent
cooling is but a temporary interruption in what soon again will be a
rapid climate warming.

I think one of the keys to alleviate some of this discussion is to
attempt to determine the triggers for two other climate shifts in
earlier times. The first of these, the "Little Ice Age" is generally
regarded by most scientists as resulting from a reduced output
of energy

from the sun. Coinciding as it did with an interval of very
little to

almost no sunspot activity, a time known as the "Maunder
Minimum", many

solar scientists suggest that as little as 0.25% decrease in solar
output initiated this cold climate period. Similarly, during
the mid

20th Century during the years from the end of the 1940's to
about the

mid 1970's, the sun was in one of its quiet modes (very few
sunspots).

The cause for what was a slightly cooler interval could logically be
linked to decreased energy from the sun. However, the quite recent
thirty year period is more commonly linked to increased dust in the
earth's atmosphere. Consistent with this view is the idea that
perhaps

the Little Ice Age too, was forced not by a decrease in the sun's
output, but by an increase in dust, not that produced by man, but by
extraterrestrial dust from a comet encounter. More details of this
particular scenario can be seen at the following website:

<[49]<http://www.bcclimate.com> <[50]<http://www.bcclimate.com/>>

<[51]<http://www.bcclimate.com/>>>

All of this raises the questions, what drove both the Little Ice
Age and

the thirty year interval in the middle of the last century? It is
possible that they were driven by the two different causes

outlined. It

is vital I think that the reason(s) for the two climate shifts be determined. This would go along way to settle the recent debate as to the importance of solar minima in initiating climate changes over more than just a few years. Further to this, the picture of the future will be clarified. If for example, decreases in solar output is proven to be of less importance during the past, then surely the present climate downturn will be likely only a temporary respite from the inexorable upward trend in temperatures worldwide. If on the other hand the solar cycles accompanied by low sun activity over decades and even longer can be proven as significant, then I believe we must re-examine the increased carbon dioxide scenario.

Rodney Chilton

(9) RESOURCES DEPLETION WORRIES

Steven Zoraster <szoraster@szoraster.com

<[52]mailto:szoraster@szoraster.com> <[53]mailto:szoraster@szoraster.com>

<[54]mailto:szoraster@szoraster.com>>>

Benny,

Certainly someone with access to the hard numbers and more knowledge than I can do better proving or disproving the following argument about the ERoEI of nuclear power in the United States:

Today, 104 nuclear reactors supply 20% of the electricity used each year

in the United States. [1]They have been doing this for approximately 25

years. [2] Many existing reactors have now been approved to operate for

60 years. While the initial costs measured in energy use 25 years ago

were high and construction often took 5 years, I doubt that the construction process for all 104 reactors, required greater energy than

the equivalent of 20% of annual electricity used 25 years ago over a 5

year period. (I include the cost of design, obtaining permits, fighting

environmental lawsuits, manufacturing parts, and actual construction,

etc., in the total energy cost.)

Today the annual operating costs of maintaining, fuelling, and repairing

existing reactors are low compared to alternate sources of electricity

except hydroelectric. The nuclear waste from these reactors has been safely stored at the reactor sites without causing a single human death.

Conclusions: Assuming the generation of electric energy in the US since about 1985 has been and will be constant, the EROEI of nuclear power using 25 year old technology is greater than 12. (Twenty percent of all electric energy generated over 60 years divided by 20% of the same amount of pre-atomic electricity generated over 5 years.) Given that total electricity use in the US has almost doubled in the last 25 years [3], the EROEI may be greater than 24. More modern proposed reactor designs, with greater standardization, simpler fuel cycles, fail safe features, and increased automation, can be expected to have higher EROEI.

(I have not included the cost of decommissioning reactors. Numbers I found online are often estimates and seldom given in terms of energy.

Because fuel costs today and to be expected in the future are low, ignoring the option of recycling used fuel is not a significant factor in my calculations.)

Steven Zoraster

[1]

[55]http://www.nei.org/resourcesandstats/nuclear_statistics/usnuclearpowerplants/

[2]

[56]<http://www.eia.doe.gov/cneaf/nuclear/page/analysis/nuclearpower.html>

Reactors were being completed between 1957 and 1996. The first large commercial reactors date to 1968. The longest "build time" is 24 years.

Some reactors have been closed after being built and have been ignored

in my argument. My use of 25 years in these calculations is certainly a

suspect approximation or average.

(12) AND FINALLY: 'PLANNED RECESSION' COULD AVOID CATASTROPHIC CLIMATE CHANGE

The Daily Telegraph, 30 September 2009

<[77]http://www.telegraph.co.uk/earth/earthnews/6248257/Planned-recession-could-avoid-catastrophic-climate-change.html>

By Louise Gray, Environment Correspondent

Britain will have to stop building airports, switch to electric cars and

shut down coal-fired power stations as part of a 'planned recession' to

avoid dangerous climate change.

At the moment the UK is committed to cutting greenhouse gases by a third by 2020.

However a new report from the Tyndall Centre for Climate Change Research

said these targets are inadequate to keep global warming below two degrees C above pre-industrial levels.

The report says the only way to avoid going beyond the dangerous tipping

point is to double the target to 70 per cent by 2020.

This would mean reducing the size of the economy through a "planned recession".

Kevin Anderson, director of the research body, said the building of new airports, petrol cars and dirty coal-fired power stations will have to

be halted in the UK until new technology provides an alternative to burning fossil fuels.

"To meet [Government] targets of not exceeding two degrees C, there would have to be a moratorium on airport expansion, stringent measures

on the type of vehicle being used and a rapid transition to low carbon technology," he said.

Prof Anderson also said individuals will have to consume less. "For most of the population it would mean fairly modest changes to how they live, maybe they will drive less, share a car to work or take more holidays in Britain."

More than 190 countries are due to meet in Copenhagen in December to decide a new international deal on climate change.

Speaking at an Oxford University conference on the threat of climate change, Prof. Anderson said rich countries will have to make much more ambitious cuts to have any chance of keeping temperature rise below four degrees C.

"If we do everything we can do then we might have a chance," he said.

Professor Briffa,

I have written a couple of blogs on the current report by Steve McIntyre that the data used by Mann to "prove" the hockey Stick was fabricated. This & the following day's
[1]<http://a-place-to-stand.blogspot.com/2009/10/global-warming-proven-deliberate-fraud.html>

As a result I have received this email from somebody I am not acquainted with throwing the entire blame on you. This seems improbable to me & possibly an alarmist damage limitation exercise. If you wish to comment I would be happy for you to do so.

"Please note: Steve McIntyre's post concerns work by climate scientist Keith Briffa and not Michael Mann. You will probably wish to correct your post.

Cheers

Avisame"

I have posted this as an update with my reply:

"My understanding is that while Briffa did the tree ring measurement, Mann, in his paper, chose to choose 12 atypical tree rings out of at least 34 to fabricate the global warming trend. My assumption is that Mann is responsible for fabrications in his own paper & that this is a damage limitation exercise. I am open to correction on this & indeed have emailed Mr Briffa to see. "

Neil Craig

You may be interested in my political blog

[2]<http://a-place-to-stand.blogspot.com/>

We received this through our enquiries desk. I assume that you are aware of this person, including those copied on the message.

If we are to respond, it would be to indicate that there are multiple sources of supporting evidence and that we continue to place our confidence in the international scientific assessment process. This confidence has proven to be well placed.

Subject: RE: Please take note of potetially serious allegations of scientific 'fraud' by CRU and Met Office

Dear Stephanie

I expect that a great deal of UKCIP work is based on the data provided by CRU (as does the work of the IPCC and of course UK climate policy). Some of this, very fundamentally, would now seem to be open to scientific challenge, and may even face future legal enquiries. It may be in the interest of UKCIP to inform itself in good time and become a little more 'uncertain' about its policy advice.

Perhaps you can comment on the following and pass the allegations made on to the relevant people.

It is beyond my expertise to assess the claims made, but they would fit into my perception of the whole 'man-made global warming' cum energy policy debate. I know several of the people involved personally and have no reason to doubt their sincerity and honour as scientists, though I am also aware of their highly critical (of IPCC science) policy

positions.

I could also let you have statements by Steve McIntyre and Ross McKitrick. Ross McKitrick currently teaches at Westminster Business School and who is fully informed about the relevant issues. He recently addressed a meeting of about 50 people in London.

Best wishes

Keith,

Here's a message from Tom. It might be worth sending anything you've got to him to have a look through. Shorter responses are probably better. Detail can go in a poster.

Pointing out how often or not Yamal is used is useful. I don't think they have done this. I think many people confuse this with the polar urals chronology. That is different and it is based on density.

M&M rely on people not checking.

Cheers

Phil

Phil,

It is distressing to read that American Stinker item. But Keith does seem to have got himself into a mess. As I pointed out in emails, Yamal is insignificant. And you say that (contrary to what M&M say) Yamal is *not* used in MBH, etc. So these facts alone are enough to shoot down M&M in a few sentences (which surely is the only way to go -- complex and wordy responses will be counter productive).

But, more generally, (even if it *is* irrelevant) how does Keith explain the McIntyre plot that compares Yamal-12 with Yamal-all? And how does he explain the apparent "selection" of the less well-replicated

chronology rather than the later (better replicated) chronology?

Of course, I don't know how often Yamal-12 has really been used in recent, post-1995, work. I suspect from what you say it is much less often than M&M say -- but where did they get their information? I presume they went through papers to see if Yamal was cited, a pretty foolproof method if you ask me. Perhaps these things can be explained clearly and concisely -- but I am not sure Keith is able to do this

as he is too close to the issue and probably quite pissed off.

And the issue of with-holding data is still a hot potato, one that affects both you and Keith (and Mann). Yes, there are reasons -- but many *good* scientists appear to be unsympathetic to these. The trouble here is that with-holding data looks like hiding something, and hiding means (in some eyes) that it is bogus science that is being hidden.

I think Keith needs to be very, very careful in how he handles this.

I'd be willing to check over anything he puts together.

Tom.

Subject: Re: NCDC data
Date: Mon Oct 5 12:35:37 2009
Cc: Ben Santer <santer1@llnl.gov>

Tom,

I can't see why the data become ERSSTv3b. b seems all that you can download.

I reviewed the 2008 paper. The version that I reviewed had something in for the problem of SST data now re drifters and ships, but they pulled that section. I recall saying it needed to be watertight and they needed to explain the spatial pattern to the ship minus drifter field. Maybe that version was a?

I was never that keen on their infilling. It biases the values before the 1920s when you infill with anomalies that are nearer to zero. You can see this in their Fig6. This version is better than their previous one.

I always assumed they still had gaps - as it would be impossible to infill the Antarctic and some parts of the Southern Oceans. Have you tried looking at their Antarctic average - 65-90S for example?

Their globe should be one domain, so not $(NH+SH)/2$ but for an infilled dataset this shouldn't make any difference.

I wonder if they downweight the infilled values in some way? They have their error field?

The 2008 paper doesn't say how they compute Global and NH and SH. Are NH and SH the same as you get?

Cheers

Phil

At 06:56 05/10/2009, Tom Wigley wrote:

Phil, Ben,

Have you looked at the latest NCDC global data? It seems odd.

The data on their site is ERSSTv3 (Smith et al. 2008). As far as I know, this is an infilled data set with no gaps. As such, $(NH+SH)/2$ should be the same as their global mean. For monthly data, this is not the case. There are actually some big differences, even recently.

Any idea why?

Tom.

Andrew,

Getting a bit fed up with these baseless allegations.

You could point out several things to Martin.

1. Projections aren't made with observed data - instrumental or paleo. They are made with climate models.

2. The initial seed for all these allegations is made on Climate Audit. Here they are quite clever and don't go over the top. They leave it to others like the National Review, the American Thinker to make the ridiculous ones.

Here is what Stephen McIntyre says on Climate Audit.

"While there is much to criticise in the handling of this data by the authors and the journals, the results do not in any way show that 'AGW is a fraud' nor that this particular study was a 'fraud'.

McIntyre has no interest in publishing his results in the peer-review literature. IPCC won't be able to assess any of it unless he does.

You dad and Susan Solomon have had runs in with him and others

3. You might like to send him this pdf and its Figure 2. Three different groups get much the same result.

Here are the two web pages we have put up so far. Keith is working on the tree one and put much more later in the week.

[1]<http://www.cru.uea.ac.uk/cru/data/availability/>

So other groups around the world have also entered into agreements. I know this doesn't make it right, but it is the way of the world with both instrumental and paleo data. I frequently try and get data from other people without success, sometimes from people who send me the pdf of their paper then tell me they can't send me the series in their plots.

[2]<http://www.cru.uea.ac.uk/cru/people/briffa/yamal2000/>

It is the right wing web sites doing all this, presumably in the build up to Copenhagen.

At 00:13 06/10/2009, Andrew Manning wrote:

Hi Phil,

is this another witch hunt (like Mann et al.)? How should I respond to the below? (I'm in the process of trying to persuade Siemens Corp. (a company with half a million employees in 190 countries!) to donate me a little cash to do some CO2 measurements here in the UK - looking promising, so the last thing I need is news articles calling into question (again) observed temperature increases - I thought we'd moved the debate beyond this, but seems that these sceptics are real die-hards!!).

Kind regards,

Andrew

From: Martin Lutyens <martinlutyens@googlemail.com>

To: Andrew Manning <a.manning@uea.ac.uk>

Dear Andrew,

I just came across an article in The Week, called "The case of the vanishing data". It writes in a rather wry and sceptical way about your UEA colleagues Phil Jones and Tom Wigley, saying that only their "homogenised" or "adjusted" historical data is available, and the original, raw data has gone missing. Apparently some other environmental gurus now want to look at the original data and were "fobbed off". According to the article, the adjusted data forms the basis for much of the climate change debate and, because others now want to look at the source data, it is "at the centre of an academic spat that could have major implications for the climate change debate". The author of the original article is Patrick Michaels in The National Review, who may just be stirring it.

The article concludes "In short, the data invoked to verify the most significant forecasts about the world's future, have simply vanished." Could you comment on this please, as someone (eg Siemens Corp.) may pick this up and I think we should all be forearmed by knowing what really happened and what to say if asked.

Many thanks, Martin

Tom,

Agreed that NCDC must have some data gaps - but this isn't very clear from the web site.

GISS is inferior - not just because it doesn't use back data. They also impose some urbanization adjustment which is based on population/night lights which I don't think is very good. Their gridding also smooths things out. Plotting all three together for land only though they look similar at decadal timescales. GISS does have less year-to-year variability - when I last looked.

I assume NCDC should add the back data in - although there isn't the need if infilling is going on OK.

I've never looked to see if NCDC changes from year to year.

I think you can say that GISS is inferior to CRUTEM3. In Ch 3 of AR4 I put the station number counts in.

GISS and NCDC have more, but almost all of this is more data in the US. Their non-use of a base period (GISS using something very odd and NCDC first differences) means they can use very short series that we can't (as they don't have base periods) but with short series it is impossible to assess for homogeneity. So some of their extra series may be very short ones as well. As you know the more important thing is where the stations are (and in time).

The paper I sent you by Adrian Simmons shows great agreement with CRUTEM3 when subsampled according to CRU grid boxes. Also shows that ERA-INTERIM is very good. ERA-INTERIM's absolute is also within 0.2 deg C of the CRU 14 deg C value. It would give about 13.8 for 1961-90. Sometime I should write this up as more and more people seem to be using 15 deg C.

Away from tomorrow till next Tuesday.

Cheers

Phil

At 23:23 05/10/2009, Tom Wigley wrote:

Phil,

Thanks again.

Re ENSO/volcs, it was me who did this first ...

Wigley, T.M.L., 2000: ENSO, volcanoes and record breaking temperatures.

Geophysical Research Letters 27, 41014104.

Then in a paper with Ben (with you as a co-author) ...

Santer, B.D., Wigley, T.M.L., Doutriaux, C., Boyle, J.S., Hansen, J.E.,

Jones, P.D., Meehl, G.A., Roeckner, E., Sengupta, S. and Taylor K.E., 2001:

Accounting for the effects of volcanoes and ENSO in comparisons of modeled

and observed temperature trends. Journal of Geophysical Research 106, 2803328059.

I think my iterative method is better than Thompson's method. He has some weird volcano results. Removing the dynamic bit is not much use in my view.

So I have all these series with volc and ENSO removed (or just ENSO removed, but accounting for volcano obfuscation). I also use running approx. 20-year regressions usually -- as you know, the ENSO-globalT link breaks down in the 1930s, so using a relationship that comes from

a (e.g.) 100-year regression would impose a spurious anti-ENSO signal on the data in the 1930s. I think this is important -- ignored by Thompson. The reason for this breakdown is obscure, but I think it is because, for some reason, the N34/SOI link (i.e., really the SST/Walker circulation link) weakens in the 1930s. We need to look at this more fully in models.

I also have these series for different regions of the globe. I need to revise and update these. It is tricky to get the regional volc signal because of SNR problems at the smaller spatial scale.

I wrote all this up more than 10 years ago, but have not got around to finalizing it to submit for publication. (I have a number of other papers like this. Once I get done with an issue to a certain level I get sidetracked on other issues.)

The amplification *does* work for warming and cooling. Theory says about +30% for TLT/surface. This works for overall variability, and for RSS trend. But oddly the ENSO and volc amplification seems to be greater than this. I've asked Ben for his thoughts on why.

Re NCDC, it seems that there *must* be data gaps. This is the only way that global can differ from $(N+S)/2$.

It also seems that the NCDC data must be ERSST3b. But their web site is not clear on this. perhaps Ben knows.

Thanks for the GISS info. So this means that their series does not change from year to year, whereas HadCRU does (albiet by only small amounts). Does NCDC change each year? The GISS thing means that it must be inferior to HadCRU and NCDC. Should I say this in my report to EPRI?

Tom.

+++++

Phil Jones wrote:

Tom,

I don't think AR4 (Ch 3) went into the TLT/surface amplification issue. You can get the pdf of the chapter from here [1]<http://ipcc-wg1.ucar.edu/wg1/wg1-report.html> . This amplification issue is only addressed in some recent papers - mainly Ben's.

The timescale argument is quite convincing. It is a pity that there is only Pinatubo

that you can test it on. El Chichon ought to work but it is confused by ENSO. Does the amplification work well for the 1997/98 El Nino?

Did you pick up that Thompson et al paper due out in J. Climate soon? Factoring out ENSO and volcanoes might help in isolating this.

[2]<http://www.atmos.colostate.edu/faculty/thompson.php>

where there is a link to the paper and also the data

[3]<http://www.atmos.colostate.edu/~davet/ThompsonWallaceJonesKennedy/>

It seems as though you can get all the extraction parts. No need for the dynamic bit.

Anyway my thought is as Pinatubo gives the amplification then ENSO ought to as well.

A thought might be to take Dave Thompson's ENSO and volcanic subtraction series, then scale them by thermodynamic theory value then subtract these from RSS and UAH. Small issue of base periods to sort out

and assume there is no lag.

Need to do this with NCDC surface as well - have to use Dave T's numbers here. This can't do the 20N-20S - just the globe.

It would of course, at this and any other time, be very nice to show that UAH is wrong.

A couple of minor things in the paper

- the amplification should work for a cooling as well - not just warming trends?

In Fig 5 in your legend LOUAH should be UAHLO. This is in Fig 4 as well.

By the way - meant to add this to the earlier email.

NCDC ERSST3 side does talk about missing data, so any of this would mean the (NH+SH)/2 won't equal the global average that NCDC calculate.

I recall you asking about GISS. One thing I have learned about GISS is that they have a cut off date of the 8th of each month. After this date nothing is changed for the previous month and nothing earlier either. This means they never incorporate any back data and they don't get the second tranche of CLIMAT data which comes about the 16th of the following month. Countries like Paraguay and Bolivia mostly come in this way, plus some in Africa.

I'll see Tom Peterson later in the week. I'll ask him about their cut offs. I think they don't change a month later. This won't lose you much data though. It was Tom who told me about the data they can't use.

Cheers

Phil

At 05:25 04/10/2009, Tom Wigley wrote:

Hi Phil,

I'm writing a report for EPRI where I have to discuss the instrumental temperature record. What they are particularly concerned with is/are the criticisms that have been leveled at the surface record, especially differences from MSU data.

I think CCSP 1.1 does a good job on this -- not sure about AR4 (which I need to re-check). But things have changed since CCSP 1.1 and AR4, and I think I can make a better case against

UAH than either of these reports.

Could you please look at the attached and give me your opinion and comments (tracked if that makes it easier)? In my view, the evidence that the UAH data are flawed is overwhelming -- but I want to make the case in a logical and balanced way. Have I succeeded? The audience level for this is IPCC report level, perhaps a bit lower. So I need to be relatively simple, but authoritative. The MSU issue also comes up later in my report where I discuss the IJOC Santer et al. paper -- which is only mentioned briefly in the attached extract.

One thing I thought I might add is more about the other two surface data sets. A key point may be that 1998 is not the warmest year in the GISS record -- do you trust GISS? I've not looked at NOAA. Perhaps this still has 1998 as warmest?

Thanks for your help.

By the way, this report was due to EPRI last week. I'm hoping to get it to them by Friday (9 Oct.)

Best wishes,

Tom

Hello, everyone,

Additional info provided below.-Viva

ERSST refers only to the ocean temperature fields. Smith et al. (2008) described the updates to create ERSST version 3. This included the use of in situ and satellite data. The paper also presented updates to the Land Surface Temperature (LST) product and culminated in the computation of the Merged Land-Ocean Surface Temperature product. However, since ca. Nov 2008, satellite data was removed from the analysis, and was called v3b, but the methodology is essentially the same as in the paper. The reason was that there was a residual cold bias in the satellite data. This caused problems for users concerned with rankings. We do not handle the page for the LST and Merged ST product, and perhaps there should be more coordination among these webpages. We have noticed the confusion about the ERSST v3 and v3b in several articles, are in the process of updating the webpage.

The in situ data used for the ERSSTv3b is ICOADS. The current v3b was computed using ICOADS release 2.4 (1784-2007). In July 2009, a new release was made with additional data pre-1900's and during the war years, but we have no plans yet to reprocess. It is during such a reprocessing that we will include any missed data. Operationally, we run the code on the 3rd of each month using the available GTS data.

The baseline for the ERSST anomalies is 1971-2000. For the LST, the GHCN box averages are provided to us as anomalies already, so I am not sure what the baseline is (I just started 3 months ago so I have not worked a lot on the Merged product codes yet). In the programs, there is an adjustment of the LST anomaly to a 1971-2000 base. So the final merged ST anomaly has a 1971-2000 base period. The best practice would be to reconstruct the original ST by adding the 1971-2000 base. Then compare or adjust or change baselines as you please.

BTW, my last name is BANZON, no R. Alas I am not related to the 261st richest person.

[2]Thomas.C.Peterson@noaa.gov wrote:

Dear Tom,

Phil Jones, who is sitting next to me here in southern Spain and also checking email, explained what you are working on and it sounds like a potentially very insightful analysis. I wish you luck.

Viva Branson (cc'd) is our new/improved keeper of ERSST. We sometimes refer to her as Dick Reynolds version b (Dick is cc'd as well). She will be able to answer your questions more accurately than I. But if I recall correctly from talking to them Monday, to avoid confusion they are trying to only make the latest (and therefore best) version of ERSST available. So the version you downloaded should be 3b. But Viva can verify this for you. I don't know which reference is currently the recommended one to use.

A decade ago, NCDC did a global land analysis and a global ocean analysis and then combined them with a weighting of 30/70. This could also arguably be the most accurate way to combine spatially incomplete data so that the world is not inappropriately weighted more towards the ocean than land (which tends to have larger gaps). Once we used Tom Smith's more spatially complete analysis, we went with a simple global average. While the data are more spatially complete, they are not complete. Data are set to missing over sea ice, much of the world north of 75N and Antarctica (Viva and I are currently reevaluating options for those last two).

ERSST is updated monthly. The SST portion is already updated for September and the land portion will wait another week or so for more data to come in. (I realize I've been assuming you are using ERSST as shorthand for NCDC's merged land/ocean data set, equivalent to HadCRU - if you're only asking about SSTs, Viva and Dick are the people to ask.)

The base period used for calculation of anomalies from the grid box mean of ERSST is, I believe, the 30 years 1961-90 (as that had the most data). So if you are using a gridded field, that is the relevant number - though Viva can verify my memory on the dates). But when we make global averaged temperature time series, we adjust the time series up or down so that the zero line is the mean of 1900-1999.

Viva, Dick, do you have anything to add (or correct)?

Tom, I've also cc'd Deke Arndt, the head of our Climate Monitoring Branch because if you find this confusing, he will probably want to make sure the web pages you read are made clearer.

Regards,
Tom P.

Subject: ERSST

Dear Toms,

Could you please clarify a few things for me ...

(1) Is the currently downloadable ERSST data version 3, or 3b?

It seems to be 3b -- but the web page is not entirely clear.

In one place it says that v.3 will be used from July, but elsewhere it says 3b will be used from July.

If it is v.3b, then does this mean that the Smith et al. reference is not (quite) appropriate?

(2) Is ERSST spatially complete? I think not. If it were, then $(NH+SH)/2$ should equal GL, but this is not the case. I'm sure you know that HadCRU uses $(NH+SH)/2$ for the global mean (arguably superior to a straight global area average). It seems odd that this issue has been glossed over.

(3) How often will ERSST be updated? I presume you are aware that HadCRU updates annually to get the late data in. It seems that ERSST only updates with new numbered versions -- so it misses late data. (GISS is worse.)

(4) What is the reference period? I think I saw somewhere on the web page that it is 1900-99? But methodologically perhaps it is difficult to define a reference period?

Thanks,
Tom

<x-flowed>
Dear Rick,

I am prepared to help in any way that I can.

As I see it, there are two key issues here.

First, the CEI and Pat Michaels are arguing that Phil Jones and colleagues at the Climatic Research Unit (CRU) willfully and intentionally "destroyed" some of the raw surface temperature data used in the construction of the gridded surface temperature datasets.

Second, the CEI and Pat Michaels contend that the CRU surface temperature datasets provided the sole basis for IPCC "discernible human influence" conclusions.

Both of these arguments are factually incorrect. First, there was no intentional destruction of the primary source data. I am sure that, over 20 years ago, Phil could not have foreseen that the raw station data might be the subject of legal proceedings by the CEI and Pat Michaels. Raw data were NOT secretly destroyed to avoid efforts by other scientists to replicate the CRU and Hadley Centre-based estimates of global-scale changes in near-surface temperature. In fact, a key point here is that other groups (primarily at NCDC and at GISS, but also in Russia) WERE able to replicate the major findings of the CRU and Hadley Centre groups. The NCDC and GISS groups performed this replication completely independently. They made different choices in the complex process of choosing input data, adjusting raw station data for known inhomogeneities (such as urbanization effects, changes in instrumentation, site location, and observation time), and gridding procedures. NCDC and GISS-based estimates of global surface temperature changes are in good accord with the HadCRUT results.

I'm sure that Pat Michaels does not have the primary source data used in his Ph.D. thesis. Perhaps one of us should request the datasets used in Michaels' Ph.D. work, and then ask the University of Wisconsin to withdraw Michaels' Ph.D. if he fails to produce every dataset and computer program used in the course of his thesis research.

I'm equally sure that John Christy and Roy Spencer have not preserved every single version of their MSU-based estimates of tropospheric temperature change. Nor is it likely that Christy and Spencer have preserved for posterity each and every computer program they used to generate UAH tropospheric temperature datasets.

[One irony here is that the Christy/Spencer claim that the troposphere had cooled over the satellite era did not stand up to rigorous scientific scrutiny. Christy and Spencer have made a scientific career out of being wrong. In contrast, CRU's claim of a pronounced increase in global-mean surface temperature over the 20th century HAS withstood the test of time.]

The CEI and Michaels are applying impossible legal standards to science. They are essentially claiming that if we do not retain - and make available to self-appointed auditors - every piece of information about every scientific paper we have ever published, we are perpetrating some vast deception on the American public. I think most ordinary citizens understand that few among us have preserved every bank statement and every utility bill we've received in the last 20 years.

The second argument - that "discernible human influence" findings are like a house of cards, resting solely on one observational dataset - is also invalid. The IPCC Third Assessment Report (TAR) considers MULTIPLE observational estimates of global-scale near-surface temperature changes. It does not rely on HadCRUT data alone - as is immediately obvious from Figure 2.1b of the TAR, which shows CRU, NCDC, and GISS global-mean temperature changes.

As pointed out in numerous scientific assessments (e.g., the IPCC TAR and Fourth Assessment Reports, the U.S. Climate Change Science Program Synthesis and Assessment Report 1.1, and the CCSP "State of Knowledge" Report), rigorous statistical fingerprint studies have now been performed with a whole range of climate variables - and not with surface temperature only. Examples include variables like ocean heat content, atmospheric water vapor, surface specific humidity, continental river runoff, sea-level pressure patterns, stratospheric and tropospheric temperature, tropopause height, zonal-mean precipitation over land, and Arctic sea-ice extent. The bottom-line message from this body of work is that natural causes alone CANNOT plausibly explain the climate changes we have actually observed. The climate system is telling us an internally- and physically-consistent story. The integrity and reliability of this story does NOT rest on a single observational dataset, as Michaels and the CEI incorrectly claim.

Michaels should and does know better. I can only conclude from his behavior - and from his participation in this legal action - that he is

being intentionally dishonest. His intervention seems to be timed to influence opinion in the run-up to the Copenhagen meeting, and to garner publicity for himself. In my personal opinion, Michaels should be kicked out of the AMS, the University of Virginia, and the scientific community as a whole. He cannot on the one hand engage in vicious public attacks on the reputations of individual scientists (in the past he has attacked Tom Karl, Tom Wigley, Jim Hansen, Mike Mann, myself, and numerous others), and on the other hand expect to be treated as a valued member of our professional societies.

The sad thing here is that Phil Jones is one of the true gentlemen of our field. I have known Phil for most of my scientific career. He is the antithesis of the secretive, "data destroying" character the CEI and Michaels are trying to portray to the outside world. Phil and Tom Wigley have devoted significant portions of their scientific careers to the construction of the land surface temperature component of the HadCRUT dataset. They have conducted this research in a very open and transparent manner - examining sensitivities to different gridding algorithms, different ways of adjusting for urbanization effects, use of various subsets of data, different ways of dealing with changes in spatial coverage over time, etc. They have thoroughly and comprehensively documented all of their dataset construction choices. They have done a tremendous service to the scientific community - and to the planet - by making gridded surface temperature datasets available for scientific research. They deserve medals as big as soup plates - not the kind of crap they are receiving from Pat Michaels and the CEI.

The bottom line, Rick, is that I am incensed at the "data destruction" allegations that are being unfairly and incorrectly leveled against Phil and Tom by the CEI and Pat Michaels. Please let me know how you think I can be most effective in rebutting such allegations. Whatever you need from me - you've got it.

I hope you don't mind, but I'm also copying my email to John Mitchell at the Hadley Centre. I know that John also feels very strongly about these issues.

With best regards,

Ben

Subject: Re: CEI formal petition to derail EPA GHG endangerment finding with charge that destruction of CRU raw data undermines integrity of global temperature record

Date: Fri, 09 Oct 2009 11:07:56 -0700

Reply-to: santer1@llnl.gov

<x-flowed>

Dear Phil,

I've known Rick Piltz for many years. He's a good guy. I believe he used to work with Mike MacCracken at the U.S. Global Change Research Program.

I'm really sorry that you have to go through all this stuff, Phil. Next time I see Pat Michaels at a scientific meeting, I'll be tempted to beat the crap out of him. Very tempted.

I'll help you to deal with Michaels and the CEI in any way that I can. The only reason these guys are going after you is because your work is of crucial importance - it changed the way the world thinks about human effects on climate. Your work mattered in the 1980s, and it matters now.

With best wishes,

Ben

Rick,

What you've put together seems fine from a quick read. I'm in Lecce in the heal of Italy till Tuesday. I should be back in the UK by Wednesday.

The original raw data are not lost either. I could reconstruct what we had from some DoE reports we published in the mid-1980s. I would start with the GHCN data. I know that the effort would be a complete wate of time though. I may get around to it some time. As you've said, the documentation of what we've done is all in the literature.

I think if it hadn't been this issue, the CEI would have dreamt up something else!

Cheers
Phil

Hi all. Any of you want to explain decadal natural variability and
signal to noise and
sampling errors to this new "IPCC Lead Author" from the BBC? As we
enter an El Nino year
and as soon, as the sunspots get over their temporary--presumed--
vacation worth a few
tenths of a Watt per meter squared reduced forcing, there will likely
be another dramatic
upward spike like 1992-2000. I heard someone--Mike Schlesinger
maybe??--was willing to bet
alot of money on it happening in next 5 years?? Meanwhile the past 10
years of global mean
temperature trend stasis still saw what, 9 of the warmest in
reconstructed 1000 year record
and Greenland and the sea ice of the North in big retreat?? Some of
you observational folks
probably do need to straighten this out as my student suggests below.

Subject: BBC U-turn on climate

Steve,

You may be aware of this already. Paul Hudson, BBCTs reporter on
climate change, on Friday

wrote that there's been no warming since 1998, and that pacific oscillations will force cooling for the next 20-30 years. It is not outrageously biased in presentation as are other skeptics' views.

<http://news.bbc.co.uk/2/hi/science/nature/8299079.stm>

<http://blogs.telegraph.co.uk/news/damianthompson/100013173/the-bbcs-amazing-u-turn-on-climate-change/>

BBC has significant influence on public opinion outside the US.

Do you think this merits an op-ed response in the BBC from a scientist?

Hi all
Well I have my own article on where the heck is global warming? We are asking that here in Boulder where we have broken records the past two days for the coldest days on record. We had 4 inches of snow. The high the last 2 days was below 30F and the normal is 69F, and it smashed the previous records for these days by 10F. The low was about 18F and also a record low, well below the previous record low. This is January weather (see the Rockies baseball playoff game was canceled on Saturday and then played last night in below freezing weather).

Trenberth, K. E. 2009. An imperative for climate change planning: tracking Earth's global energy. Current Opinion in Environmental Sustainability, 1, 19-27.
doi:10.1016/j.coust.2009.06.001. [1][PDF] (A PDF of the published version can be obtained from the author.)

The fact is that we can't account for the lack of warming at the moment and it is a travesty that we can't. The CERES data published in the August BAMS 09 supplement on 2008 shows there should be even more warming; but the data are surely wrong. Our observing system is inadequate.

That said there is a LOT of nonsense about the PDO. People like CPC are tracking PDO on a monthly basis but it is highly correlated with ENSO. Most of what they are seeing is the change in ENSO not real PDO. It surely isn't decadal. The PDO is already reversing with the switch to El Nino. The PDO index became positive in September for first time since Sept 2007. see

<x-flowed>
Dear folks,

You may be interesting in this snippet of information about Pat Michaels. Perhaps the University of Wisconsin ought to open up a public comment period to decide whether Pat Michaels, PhD needs re-assessing?

Michaels' PhD was, I believe, supervised by Reid Bryson. It dealt with statistical (regression-based) modeling of crop-climate relationships. In his thesis, Michaels claims that his statistical model showed that weather/climate variations could explain 95% of the inter-annual variability in crop yields. Had this been correct, it would have been a remarkable results. Certainly, it was at odds with all previous studies of crop-climate relationships, which generally showed that weather/climate could only explain about 50% of inter-annual yield variability.

How did result come about? The answer is simple. In Michaels' regressions he included a trend term. This was at the time a common way to account for the effects of changing technology on yield. It turns out that the trend term accounts for 90% of the variability, so that, in Michaels' regressions, weather/climate explains just 5 of the remaining 10%. In other words, Michaels' claim that weather/climate explains 95% of the variability is completely bogus.

Apparently, none of Michaels' thesis examiners noticed this. We are left with wondering whether this was deliberate misrepresentation by Michaels, or whether it was simply ignorance.

As an historical note, I discovered this many years ago when working with Dick Warrick and Tu Qipu on crop-climate modeling. We used a spatial regression method, which we developed for the wheat belt of southwestern Western Australia. We carried out similar analyses for winter wheat in the USA, but never published the results.

Wigley, T.M.L. and Tu Qipu, 1983: Crop-climate modelling using spatial

patterns of yield and climate: Part 1, Background and an example from

Australia. Journal of Climate and Applied Meteorology 22, 1831-1841.

There never was a "Part 2".

Tom

Dear all,

At the risk of overload, here are some notes of mine on the recent lack of warming. I look at this in two ways. The first is to look at the difference between the observed and expected anthropogenic trend relative to the pdf for unforced variability. The second is to remove ENSO, volcanoes and TSI variations from the observed data.

Both methods show that what we are seeing is not unusual. The second method leaves a significant warming over the past decade.

These sums complement Kevin's energy work.

Kevin says ... "The fact is that we can't account for the lack of warming at the moment and it is a travesty that we can't". I do not agree with this.

Tom.

Mike
Here are some of the issues as I see them:
Saying it is natural variability is not an explanation. What are the physical processes?
Where did the heat go? We know there is a build up of ocean heat prior to El Nino, and a discharge (and sfc T warming) during late stages of El Nino, but is the observing system sufficient to track it? Quite aside from the changes in the ocean, we know there are major changes in the storm tracks and teleconnections with ENSO, and there is a LOT more rain on land during La Nina (more drought in El Nino), so how does the albedo change overall (changes in cloud)? At the very least the extra rain on land means a lot more heat goes into evaporation rather than raising temperatures, and so that keeps land temps down; and should generate cloud. But the resulting evaporative cooling means the heat goes into atmosphere and should be radiated to space: so we should be able to track it with CERES data. The CERES data are unfortunately wanting and so too are the cloud data. The ocean data are also lacking although some of that may be related to the ocean current changes and burying heat at depth where it is not picked up. If it is sequestered at depth then it comes back to haunt us later and so we should know about it.

Kevin
Michael Mann wrote:

Kevin, that's an interesting point. As the plot from Gavin I sent shows, we can easily account for the observed surface cooling in terms of the natural variability seen in the CMIP3 ensemble (i.e. the observed cold dip falls well within it). So in that sense, we can "explain" it. But this raises the interesting question, is there something going on here w/ the energy & radiation budget which is inconsistent with the modes of internal variability that leads to similar temporary cooling periods within the models. I'm not sure that this has been addressed--has it?

m

Hi Tom
How come you do not agree with a statement that says we are no where close to knowing where energy is going or whether clouds are changing to make the planet brighter. We are not close to balancing the energy budget. The fact that we can not account for what is happening in the climate system makes any consideration of geoengineering quite hopeless as we will never be able to tell if it is successful or not! It is a travesty!

Subject: BBC U-turn on climate

Steve,

You may be aware of this already. Paul Hudson, BBC's reporter on climate change, on Friday wrote that there's been no warming since 1998, and that pacific oscillations will force cooling for the next 20-30 years. It is not outrageously biased in presentation as are other skeptics' views.

[7]<http://news.bbc.co.uk/2/hi/science/nature/8299079.stm>

[8]<http://blogs.telegraph.co.uk/news/damianthompson/100013173/the-bbcs-amazing-u-turn-on-climate-change/>

BBC has significant influence on public opinion outside the US.

Do you think this merits an op-ed response in the BBC from a scientist?

thanks Kevin, yes, it's a matter of what question one is asking. to argue that the observed global mean temperature anomalies of the past decade falsifies the model projections of global mean temperature change, as contrarians have been fond of claiming, is clearly wrong, but that doesn't mean we can explain exactly what's going on, there is always the danger of falling a bit into the "we don't know everything, so we know nothing" fallacy. hence, I wanted to try to clarify where we all agree, and where there may be disagreement.

Here are some of the issues as I see them:
Saying it is natural variability is not an explanation. What are the physical processes? Where did the heat go? We know there is a build up of ocean heat prior to El Nino, and a discharge (and sfc T warming) during late stages of El Nino, but is the observing system sufficient to track it? Quite aside from the changes in the ocean, we know there are major changes in the storm tracks and teleconnections with ENSO, and there is a LOT more rain on land during La Nina (more drought in El Nino), so how does the albedo change overall (changes in cloud)? At the very least the extra rain on land means a lot more heat goes into evaporation rather than raising temperatures, and so that keeps land temps down; and should generate cloud. But the resulting evaporative cooling means the heat goes into atmosphere and should be radiated to space: so we should be able to track it with CERES data. The CERES data are unfortunately wanting and so too are the cloud data. The ocean data are also lacking although some of that may be related to the ocean current changes and burying heat at depth where it is not picked up. If it is sequestered at depth then it comes back to haunt us later and so we should know about it.
Kevin

Michael Mann wrote:

Kevin, that's an interesting point. As the plot from Gavin I sent shows, we can easily account for the observed surface cooling in terms of the natural variability seen in the CMIP3 ensemble (i.e. the observed cold dip falls well within it). So in that sense, we can "explain" it. But this raises the interesting question, is there something going on here w/ the energy & radiation budget which is inconsistent with the modes of internal variability that leads to similar temporary cooling periods within the models. I'm not sure that this has been addressed--has it?

Hi Tom
How come you do not agree with a statement that says we are no where close to knowing where energy is going or whether clouds are changing to make the planet brighter. We are not close to balancing the energy budget. The fact that we can not account for what is happening in the climate system makes any consideration of geoengineering quite hopeless as we will never be able to tell if it is successful or not! It is a travesty!
Kevin
Tom Wigley wrote:

Dear all,

At the risk of overload, here are some notes of mine on the recent

lack of warming. I look at this in two ways. The first is to look at

the difference between the observed and expected anthropogenic trend relative to the pdf for unforced variability. The second is to remove ENSO, volcanoes and TSI variations from the observed data.

Both methods show that what we are seeing is not unusual. The second

method leaves a significant warming over the past decade.

These sums complement Kevin's energy work.

Kevin says ... "The fact is that we can't account for the lack of warming at the moment and it is a travesty that we can't". I do not

agree with this.

Tom.

Kevin Trenberth wrote:

Hi all

Well I have my own article on where the heck is global warming? We are asking that here in Boulder where we have broken records the past two days for the coldest days on record. We had 4 inches of snow. The high the last 2 days was below 30F and the normal is 69F, and it smashed the previous records for these days by 10F. The low was about 18F and also a record low, well below the previous record low. This is January weather (see the Rockies baseball playoff game was canceled on saturday and then played last night in below freezing weather).

Trenberth, K. E., 2009: An imperative for climate change planning: tracking Earth's global energy. Current Opinion in Environmental Sustainability, 1, 19-27. doi:10.1016/j.cosust.2009.06.001. [PDF]
<[http://www.cgd.ucar.edu/cas/Trenberth/trenberth.papers/EnergyDiagnostics09final.pdf]>
(A PDF of the published version can be obtained from the author.)

The fact is that we can't account for the lack of warming at the moment and it is a travesty that we can't. The CERES data published in the August BAMS 09 supplement on 2008 shows there should be even more warming; but the data are surely wrong. Our observing system is inadequate.

That said there is a LOT of nonsense about the PDO. People like CPC are tracking PDO on a monthly basis but it is highly correlated with ENSO. Most of what they are seeing is the change in ENSO not real PDO. It surely isn't decadal. The PDO is already reversing with the switch to El Nino. The PDO index became positive in September for first time since Sept 2007. see

Subject: BBC U-turn on climate

Steve,

You may be aware of this already. Paul Hudson, BBC's reporter on climate change, on Friday wrote that theres been no warming since 1998, and that pacific oscillations will force cooling for the next 20-30 years. It is not outrageously biased in presentation as are other skeptics views.

[7]<http://news.bbc.co.uk/2/hi/science/nature/8299079.stm>

[8]<http://blogs.telegraph.co.uk/news/damianthompson/100013173/the-bbcs-amazing-u-turn-on-climate-change/>

BBC has significant influence on public opinion outside the US.

Do you think this merits an op-ed response in the BBC from a scientist?

Tom,

What you'd need to point this out is a pdf of his thesis! Or is there a paper where the thesis is referred to?

I recall Pat wasn't very good at writing stuff up. There was one paper about warming in Alaska that I recall either you or me reviewing. It related to surface warming in Alaska and the borehole from Lachenbruch/Marshall (?) from about 1986.

With the pdf you wouldn't need to say that much, as it is as you say stupid to leave the Trend in with the rest of the variance.

Did the NCDC info help you sort out that data. Tom P told me that they don't infill certain areas in early decades, so there is missing data. Tom P isn't that keen on the method. He rightly thinks that it discourages them from looking for early data or including any new stuff they get - as they have infilled it, so it won't make a difference. It won't make a difference, but that isn't the point.

Cheers

Phil

At 02:45 14/10/2009, Tom Wigley wrote:

Dear folks,

You may be interesting in this snippet of information about Pat Michaels. Perhaps the University of Wisconsin ought to open up a public comment period to decide whether Pat Michaels, PhD needs re-assessing?

Michaels' PhD was, I believe, supervised by Reid Bryson. It dealt with statistical (regression-based) modeling of crop-climate relationships. In his thesis, Michaels claims that his statistical model showed that weather/climate variations could explain 95% of the inter-annual variability in crop yields. Had this been correct, it would have been a remarkable results. Certainly, it was at odds with all previous studies of crop-climate relationships, which generally showed that weather/climate could only explain about 50% of inter-annual yield variability.

How did result come about? The answer is simple. In Michaels' regressions he included a trend term. This was at the time a common way to account for the effects of changing technology on yield. It turns out that the trend term accounts for 90% of the variability, so that, in Michaels' regressions, weather/climate explains just 5 of the remaining 10%. In other words, Michaels' claim that weather/climate explains 95% of the variability is completely bogus.

Apparently, none of Michaels' thesis examiners noticed this. We are left with wondering whether this was deliberate misrepresentation

by Michaels, or whether it was simply ignorance.

As an historical note, I discovered this many years ago when working with Dick Warrick and Tu Qipu on crop-climate modeling. We used a spatial regression method, which we developed for the wheat belt of southwestern Western Australia. We carried out similar analyses for winter wheat in the USA, but never published the results.

Wigley, T.M.L. and Tu Qipu, 1983: Crop-climate modelling using spatial patterns of yield and climate: Part 1, Background and an example from Australia. Journal of Climate and Applied Meteorology 22, 1831-1841.

There never was a "Part 2".

Phil Jones and Ben Santer respond to CEI and Pat Michaels attack on temperature data record

/Posted on Tuesday, October 13, 2009

/Prof. Phil Jones, Director of the Climatic Research Unit at the University of East Anglia in the UK and Ben Santer at Lawrence Livermore National Laboratory comment in response to a petition to EPA by the Competitive Enterprise Institute and Pat Michaels, which misleadingly seeks to obstruct EPAs process in making an endangerment finding on greenhouse gases. This new CEI tactic is to call into question the integrity of the global temperature data record and, by implication, the integrity of leading climate scientists.

/E&E News PM/ reported on October 7 (CLIMATE: Free-market group attacks data behind EPA endangerment proposal):

The Competitive Enterprise Institute a vocal foe of EPAs efforts to finalize its endangerment finding petitioned the agency this week to reopen the public comment period on the proposal, arguing that critical data used to formulate the plan have been destroyed and that the available data are therefore unreliable.

At issue is a set of raw data from the Climatic Research Unit at the University of East Anglia in Norwich, England, that includes surface temperature averages from weather stations around the world.

Republican senators also weighed in yesterday, urging EPA to reopen the public comment period on the endangerment finding to investigate the scientific merit of the research data.

We talked with E&E News on this latest maneuver by the ideologues at CEI and contrarian scientist Pat Michaels and posted on October 8

<[2]<http://www.climatesciencewatch.org/index.php/csw/details/cei-epa-endangerment-petition-oct09/>>: CEI global warming denialists try another gambit seeking to derail EPA endangerment finding

The process initiated by the CEI petition will, we suppose, produce an appropriate response for the record from EPA and relevant members of the science community. And

while that process drags on, CEI and Michaels no doubt will use their petition as a basis for attempting to muddy the waters of scientific discourse, while slinging leaders of the international climate science community and questioning their motives. A few of those leaders have begun to comment on this attempt. We post below comments Climate Science Watch has received from Ben Santer at Lawrence Livermore National Laboratory and Prof. Phil Jones, Director of the Climatic Research Unit at the University of East Anglia in the UK:

Comment by Benjamin D. Santer

<[3]<http://www-pcmdi.llnl.gov/about/staff/Santer/index.php>>, Program for Climate Model Diagnosis and Intercomparison, Lawrence Livermore National Laboratory:

As I see it, there are two key issues here.

First, the Competitive Enterprise Institute (CEI) and Pat Michaels are arguing that Phil Jones and colleagues at the Climatic Research Unit at the University of East Anglia (CRU) willfully, intentionally, and suspiciously destroyed some of the raw surface temperature data used in the construction of the gridded surface temperature datasets.

Second, the CEI and Pat Michaels contend that the CRU surface temperature datasets provided the sole basis for IPCC discernible human influence conclusions.

Both of these arguments are incorrect. First, there was no intentional destruction of the primary source data. I am sure that, over 20 years ago, the CRU could not have foreseen that the raw station data might be the subject of legal proceedings by the CEI and Pat Michaels. Raw data were NOT secretly destroyed to avoid efforts by other scientists to replicate the CRU and Hadley Centre-based estimates of global-scale changes in near-surface temperature. In fact, a key point here is that other groups primarily at the NOAA National Climatic Data Center (NCDC) and at the NASA Goddard Institute for Space Studies (GISS), but also in Russia WERE able to replicate the major findings of the CRU and UK Hadley Centre groups. The NCDC and GISS groups performed this replication completely independently. They made different choices in the complex process of choosing input data, adjusting raw station data for known inhomogeneities (such as urbanization effects, changes in instrumentation, site location, and observation time), and gridding procedures. NCDC and GISS-based estimates of global surface temperature changes are in good accord with the HadCRUT data results.

The second argument that discernible human influence findings are like a house of cards, resting solely on one observational dataset is also invalid. The IPCC Third Assessment Report (TAR) considers MULTIPLE observational estimates of global-scale near-surface temperature changes. It does not rely on HadCRUT data alone as is immediately obvious from Figure 2.1b of the TAR, which shows CRU, NCDC, and GISS global-mean temperature changes.

As pointed out in numerous scientific assessments (e.g., the IPCC TAR and Fourth Assessment Reports, the U.S. Climate Change Science

Program Synthesis and Assessment Report 1.1 (Temperature trends in the lower atmosphere: Steps for understanding and reconciling differences), and the state of knowledge report, Global Climate Change Impacts on the United States, rigorous statistical fingerprint studies have now been performed with a whole range of climate variables and not with surface temperature only. Examples include variables like ocean heat content, atmospheric water vapor, surface specific humidity, continental river runoff, sea-level pressure patterns, stratospheric and tropospheric temperature, tropopause height, zonal-mean precipitation over land, and Arctic sea-ice extent. The bottom-line message from this body of work is that natural causes alone CANNOT plausibly explain the climate changes we have actually observed. The climate system is telling us an internally- and physically-consistent story. The integrity and reliability of this story does NOT rest on a single observational dataset, as Michaels and the CEI incorrectly claim.

I have known Phil for most of my scientific career. He is the antithesis of the secretive, data destroying character the CEI and Michaels are trying to portray to the outside world. Phil and Tom Wigley have devoted significant portions of their scientific careers to the construction of the land surface temperature component of the HadCRUT dataset. They have conducted this research in a very open and transparent manner examining sensitivities to different gridding algorithms, different ways of adjusting for urbanization effects, use of various subsets of data, different ways of dealing with changes in spatial coverage over time, etc. They have thoroughly and comprehensively documented all of their dataset construction choices. They have done a tremendous service to the scientific community and to the planet by making gridded surface temperature datasets available for scientific research. They deserve medals not the kind of deliberately misleading treatment they are receiving from Pat Michaels and the CEI.

(Santer has received several honors, awards and fellowships including the Department of Energy Distinguished Scientist Fellowship

<[4]https://publicaffairs.llnl.gov/news/news_releases/2005/NR-05-10-01.html>, the E.O. Lawrence Award, and the Genius Award by the MacArthur Foundation.)

Comment by Prof. Phil Jones <[5]<http://www.cru.uea.ac.uk/cru/people/pjones/>>, Director, Climatic Research Unit (CRU), and Professor, School of Environmental Sciences, University of East Anglia, Norwich, UK:

No one, it seems, cares to read what we put up <[6]<http://www.cru.uea.ac.uk/cru/data/temperature/>> on the CRU web page. These people just make up motives for what we might or might not have done.

Almost all the data we have in the CRU archive is exactly the same as in the Global Historical Climatology Network (GHCN) archive used by the NOAA National Climatic Data Center [see here

<[7]<http://www.ncdc.noaa.gov/oa/climate/ghcn-monthly/index.php>> and here <[8]<http://www.ncdc.noaa.gov/oa/climate/research/ghcn/ghcngrid.html>>].

The original raw data are not lost. I could reconstruct what we had from U.S. Department of Energy reports we published in the mid-1980s. I would start with the GHCN data. I know that the effort would be a complete waste of time, though. I may get around to it some time. The documentation of what weve done is all in the literature.

If we have lost any data it is the following:

1. Station series for sites that in the 1980s we deemed then to be affected by either urban biases or by numerous site moves, that were either not correctable or not worth doing as there were other series in the region.
2. The original data for sites for which we made appropriate adjustments in the temperature data in the 1980s. We still have our adjusted data, of course, and these along with all other sites that didnt need adjusting.
3. Since the 1980s as colleagues and National Meteorological Services <[9]http://www.wmo.int/pages/members/index_en.html> (NMSs) have produced adjusted series for regions and or countries, then we replaced the data we had with the better series.

In the papers, Ive always said that homogeneity adjustments are best produced by NMSs. A good example of this is the work by Lucie Vincent in Canada. Here we just replaced what data we had for the 200+ sites she sorted out.

The CRUTEM3 data for land look much like the GHCN and NASA Goddard Institute for Space Studies data

<[10]<http://data.giss.nasa.gov/gistemp/>> for the same domains. Apart from a figure in the IPCC Fourth Assessment Report (AR4) showing this, there is also this paper from Geophysical Research Letters in 2005 by Russ Vose et al.

<[11]<http://www.climate-science-watch.org/file-uploads/Vose-et-al-TempTrends-GRL2005.pdf>>
Figure 2 is similar to the AR4 plot.

I think if it hadnt been this issue, the Competitive Enterprise Institute would have dreamt up something else!

Kevin,

I didn't mean to offend you. But what you said was "we can't account for the lack of warming at the moment". Now you say "we are no where close to knowing where energy is going". In my eyes these are two different things -- the second relates to our level of understanding, and I agree that this is still lacking.

Tom.

Gavin,

I just think that you need to be up front with uncertainties and the possibility of compensating errors.

Tom.

Tom, with respect to the difference between the models and the data, the fundamental issue on short time scales is the magnitude of the internal variability. Using the full CMIP3 ensemble at least has multiple individual realisations of that internal variability and so is much more suited to a comparison with a short period of observations. MAGICC is great at the longer time scale, but its neglect of unforced variability does not make it useful for these kinds of comparison.

The kind of things we are hearing "no model showed a cooling", the "data is outside the range of the models" need to be addressed directly.

WE should make a statement along these lines. We should also stress that McIntyres analysis has not been peer-reviewed (& we need to explain what this means - for the man-in-the street).

Given the fact that this campaign is clearly not going to die down & we now have a silly attempt to escalate it locally (dragging Norfolk's reputation thro the mud), I have revised my view & feel we do need to pursue the spectator more vigorously. To me, it seems straightforward - Keith has been accused of fraud on an official Spectator website - that is (wherever the legal word is).

Trevor

Hi James

Thanks for doing this and let's keep it moving as fast as possible. Yes the formatting in places is disconcerting and the line numbering is a bit on and off.

I have suggestions for changing two words.

Line 13 "severely" to "greatly"

Line 79 "more dramatic" to "greater"

As they stand, words like those used carry a lot of extra subjective tone that implies "bad" or has a commentary that is not desirable as per Rev 3. I wonder if you should not be a bit more specific in responding to Rev 3 and say what other words were changed in the abstract at least? If it were "word" I would send in a version of the abstract with tracking on. It might make the difference between having the editor approve it and sending it back to Rev 3.

Best regards

Kevin

Mike,

Sept 2009 isn't up yet. I expect it in the next day or so. I'll check again tomorrow. Away Friday and Mon/Tues next week. Our web site will update on Sunday if the HC have updated theirs.

Seems nothing yet on Keith's Yamal.

One of the Russians has a reason why Khad hasn't grown so much. All the sites in the region have permafrost at depth. Those nearer the rivers have the permafrost at a greater depth, partly due to the rivers. Warmth in the 20th century has meant greater depths for the roots. Khad is a walk from the river and slightly higher, so possibly has less available soil depth above the permafrost. All the sites are sampled through river transport. When the coring was done in the 1980s and early 1990s the fieldwork teams ate a lot of fish!

Permafrost idea is impossible to prove without going back to the sites and drilling down. The Russians plan to do this when they revisit the area, but that depends on resources.

Cheers

At 17:07 27/10/2009, Michael Mann wrote:

Hi Phil,

Thanks--we know that. The point is simply that if we want to talk about about a meaningful "2009" anomaly, every additional month that is available from which to calculate an annual mean makes the number more credible. We already have this for GISTEMP, but have been awaiting HadCRU to be able to do a more decisive update of the status of the disingenuous "globe is cooling" contrarian talking point,

mike

p.s. be a bit careful about what information you send to Andy and what emails you copy him in on. He's not as predictable as we'd like

On Oct 27, 2009, at 1:04 PM, Phil Jones wrote:

Mike,

Yes a link will be fine.

I'll look into Sept numbers, but you shouldn't be looking at individual months.

Phil

At 16:54 27/10/2009, Michael Mann wrote:

thanks Phil,

Perhaps we'll do a simple update to the Yamal post, e.g. linking Keith/s new page--Gavin t?

As to the issues of robustness, particularly w.r.t. inclusion of the Yamal series, we actually emphasized that (including the Osborn and Briffa '06 sensitivity test) in our original post! As we all know, this isn't about truth at all, its about plausibly deniable accusations,

m

p.s. any word on HadCRU Sep numbers yet???

On Oct 27, 2009, at 12:37 PM, Phil Jones wrote:

Gavin, Mike, Andy,

It has taken Keith longer than he would have liked, but it is up. There is a lot to read and understand. It is structured for different levels. The link goes to the top level. There is more detail below this and then there are the data below that.

You can either go to our main page

[1]<http://www.cru.uea.ac.uk/> then click on the link

or directly here

[2]<http://www.cru.uea.ac.uk/cru/people/briffa/yamal2009/>

I'll let you make up you own minds! It seems to me as though McIntyre cherry picked for effect.

There is an additional part that shows how many series from Ch 6 of AR4 used Yamal - most didn't! Also there is a sensitivity test of omitting it - which comes from the Supplementary Info with Osborn and Briffa (2006). As expected omitting it makes very little difference. To get to this follow the links from the above link.

McIntyre knows that the millennial temperature record is pretty robust, otherwise he would produce his own series. Similarly the instrumental temperature is even more robust, which he also knows.

Cheers

Phil

Subject: Yamal response from Keith

Date: Wed Oct 28 12:26:39 2009

John,

[1]<http://www.cru.uea.ac.uk/cru/people/briffa/yamal2009/>

This went up last night about 5pm. There is a lot to read at various levels. If you get time just the top level is necessary. There is also a bit from Tim Osborn showing that Yamal was used in 3 of the 12 millennial reconstructions used in Ch 6.

Also McIntyre had the Yamal data in Feb 2004 - although he seems to have forgotten this. Keith succeeding in being very restrained in his response. McIntyre knew what he was doing when he replaced some of the trees with those from another site.

Cheers

Dear Professor Briffa, I am pleased to hear that you appear to have recovered from your recent illness sufficiently to post a response to the controversy surrounding the use of the Yamal chronology;

([5]<http://www.cru.uea.ac.uk/cru/people/briffa/yamal2009/cautious/cautious.htm>) and the chronology itself;

([6]<http://www.cru.uea.ac.uk/cru/people/briffa/yamal2009/>)

Unfortunately I find your explanations lacking in scientific rigour and I am more inclined to believe the analysis of McIntyre

([7]<http://www.climateaudit.org/?p=7588>)

Can I have a straightforward answer to the following questions

- 1) Are the reconstructions sensitive to the removal of either the Yamal data and Strip pine bristlecones, either when present singly or in combination?
- 2) Why these series, when incorporated with white noise as a background, can still produce a Hockey-Stick shaped graph if they have, as you suggest, a low individual weighting?

And once you have done this, please do me the courtesy of answering my initial email.

Dr. D.R. Keiller

Subject: Yamal and paleoclimatology

Dear Professor Briffa, my apologies for contacting you directly, particularly since I hear that you are unwell.

However the recent release of tree ring data by CRU has prompted much discussion and indeed disquiet about the methodology and conclusions of a number of key papers by you and co-workers.

As an environmental plant physiologist, I have followed the long debate starting with Mann et al (1998) and through to Kaufman et al (2009).

As time has progressed I have found myself more concerned with the whole scientific basis of dendroclimatology. In particular;

- 1) The appropriateness of the statistical analyses employed
- 2) The reliance on the same small datasets in these multiple studies
- 3) The concept of "teleconnection" by which certain trees respond to the "Global Temperature Field", rather than local climate
- 4) The assumption that tree ring width and density are related to temperature in a linear manner.

Whilst I would not describe myself as an expert statistician, I do use inferential statistics routinely for both research and teaching and find difficulty in understanding the statistical rationale in these papers.

As a plant physiologist I can say without hesitation that points 3 and 4 do not agree with the accepted science.

There is a saying that "extraordinary claims require extraordinary proof". Given the scientific, political and economic importance of these papers, further detailed explanation is urgently required.

Yours sincerely,
Dr. Don Keiller.

I know, I feel for you being in that position. If its any consolation we've had it here for years, very pointed commentary at all external seminars and elsewhere, always coming back to the same theme. Since Sonja retired I am a lot more free to push my environmental interests without ongoing critique of my motives and supposed misguidedness - I've signed my department up to 10:10 campaign and have a taskforce of staff and students involved in it.... Every now and then people say to me sotto voce with some bemusement, 'and when Sonja finds out, how will you explain it to her...!'

Dear Graham,

Thanks for the speedy reply. Just like you are, we are trying here to do bits of research mostly related to the current set of contracts we have. Trying to respond to blogs is just not part of the deadlines we have entered into with the Research Councils, the EU and DEFRA.

You are probably aware of this, but the journal Sonja edits is at the very bottom of almost all climate scientists lists of journals to read. It is the journal of choice of climate change skeptics and even here they don't seem to be bothering with journals at all recently.

I don't think there is anything more you can do. I have vented my frustration and have had a considered reply from you.

Cheers
Phil

Thanks, Phil.

A bunch of us are putting something together on the latest Lindzen and Choi crap (GRL). Not a comment, but a separate paper to avoid giving Lindzen the last word.

Tom.

Subject: LAND vs OCEAN
Date: Fri, 06 Nov 2009 17:36:15 -0700

<x-flowed>

We probably need to say more about this. Land warming since 1980 has been twice the ocean warming -- and skeptics might claim that this proves that urban warming is real and important.

See attached note.

Comments?

Dear Participants of the IPCC Expert Meeting on Detection & Attribution,
dear Colleagues,

Please find attached the draft version of the Good Practice Guidance Paper (GPGP) which has been prepared by the Core Writing Team (CWT) following the IPCC joint WGI/II Expert Meeting on Detection and Attribution. Gabi, Ove, Camille, David, Gino, Marty, Peter, and Sari, have been working very hard to meet the TSU deadline and have managed to provide the Co-Chairs with the attached draft version right in time for presentation at the IPCC Plenary in Bali the last week of October. We all owe them our sincere thanks for the efforts put into the preparation of this document.

Logistics:

We would now like to invite all participants of the Geneva Expert Meeting to review the GPGP and to provide comments and suggestions on the attached draft within 2 weeks from today (i.e. by *November 24*). If you do plan to provide your inputs, please prepare your comments in a separate document (word or plain text) in order to facilitate the handling of the comments from potentially ~30 participants. Submission of the files will be by email to the WGI TSU at wg1@ipcc.unibe.ch. We will collect all the reviews, combine them into an easily manageable format and will then forward them to the CWT. The task of the CWT will then be to consider all your comments and revise the GPGP accordingly. We do not plan to send the Guidance Paper out for a second round of comments, but trust that the CWT will make every effort to take your suggestions into account as much as possible.

Changes to terminology discussed in Geneva:

Please note that the CWT, after intense discussions, had to make a few changes to the language used in the "approved" documents from the last day's final plenary. One of the changes is the change from "direct" to "single step" attribution. Given the level of discussion created within the CWT and also during the meeting, the CWT felt it was more constructive NOT to insinuate which methods are better or stronger and so strived for neutral language, particularly as the views about what constitutes a strong method differed between groups (not only IPCC WGs). Note that the word "direct" already had created discussion during the final plenary of the Geneva meeting and was flagged as unresolved in the material sent to the CWT by the WGI TSU. As a consequence, the CWT has then changed "sequential" to "multi-step" to keep language consistent. The CWT has highlighted in the text by brackets where language was changed in order to maintain maximum transparency.

Material to be included in the Expert Meeting Report:

The GPGP will be part of the full meeting report which we are currently preparing at the WGI TSU. The full meeting report will include all the materials from the conference documentation, i.e. abstracts, participants list, agenda, etc. In Geneva, we also discussed to include additional science background material going along with the Guidance Paper. In light of the substantial GPGP we currently have, it seems sufficient to add a few (2-3) practical examples of D&A to the report which would illustrate and clarify in concrete terms the different points raised in the GPGP. As such examples are of a different nature than the GPGP text, we propose to present them in separate boxes. Our proposal is that the CWT will work on these D&A examples while the participants are commenting on the GPGP, and while the WGI TSU works on preparing the full meeting report. A further science element to be included in the full meeting report would be a non-comprehensive bibliography of D&A literature added at the end of the report (see separate email following).

I hope this way forward is acceptable to you. Thank you very much for your continued efforts and contributions to this important IPCC activity. We are looking forward to your inputs,

Cheers, Kasper

Subject: Re: Twentieth Century Reanalysis preliminary version 2 data - One other thing!
Date: Tue Nov 10 12:40:26 2009

Gil,

One other good plot to do is this. Plot land minus ocean. as a time series.

This should stay relatively close until the 1970s. Then the land should start moving away from the ocean.

This departure is part of AGW. The rest is in your Co2 increases.

Cheers

Phil

Gil,

These will do for my purpose. I won't pass them on. I am looking forward to the draft paper. As you're fully aware you're going to have to go some ways to figuring out what's causing the differences.

You will have to go down the sub-sampling, but I don't think it is going to make much difference. The agreement between CRU and GISS is amazing good, as already know. You ought to include the NCDC dataset as well.

[1]<http://www.ncdc.noaa.gov/oa/climate/research/anomalies/index.html> the ERSST3b dataset.

In the lower two plots there appear to be two types of differences, clearer in the NH20-70 land domain.

The first is when reanl20v2 differs for a single year (like a year in the last 1960s, 1967 or 1968) and then when it differs for about 10 years or so. It is good that it keeps coming back. For individual years there are a couple of years in the first decade of the 20th century (the 1900s).

The longer periods are those you've noticed - the 1920s and the 1890s. There is also something up with the period 1955-65 and the 1970s. The 1920s seems to get back then go off again from about 1935 to early 1940s. Best thing to try and isolate some of the reasons would be maps for decades or individual years. For the 1920s I'd expect the differences to be coming from Siberia as opposed to Canada. I think the 1890s might be just down to sparser coverage. The 1890s is the only period where the difference brings your pink line back towards the long-term zero. All the others have the pink line more extreme than the HadCRUT3/GISS average.

Rob Allan just called. I briefly mentioned this to him. He suggested maps of data input during these times. He also suggested looking at the spread of the ensembles. Your grey spread is sort of this, but this is a different sort of ensemble to what Rob implied you might have?

One final thing - don't worry too much about the 1940-60 period, as I think we'll be changing the SSTs there for 1945-60 and with more digitized data for 1940-45. There is also a tendency for the last 10 years (1996-2005) to drift slightly low - all 3 lines. This may be down to SST issues.

Once again thanks for these! Hoping you'll send me a Christmas Present of the draft!

Cheers

Phil

At 20:45 09/11/2009, you wrote:

Phil,

1. I didn't get the attached.

Both version1 and version2 use HadISST1.1 for SST and sea ice.

2. time-varying CO2, volcanic aerosols, and solar variability (11-year cycle until 1949, "observed" after that) are specified.

Attached is a research figure. Please do not share.

In it, I have plotted the annual average (top panel) 50S to 70N global average 2m temperature from 20CRv2, SST/2m temperature from HadCRU3, SST/2m temperature from GISTEMP 1200km, and the 90% range of 2m air temperature from 25 CMIP3 models that can be extended beyond their 20C3M runs with SRESA1B. The ensemble mean is the thick gray curve. Averages are July-June.

(middle panel) 50S to 70N land-only 2m temperature from 20CRv2, 2m temperature from CRUTEM3, 2m temperature from GISTEMP land-only 1200km. CMIP3 data is the same.

(bottom panel) same as middle panel but for Northern Hemisphere land-only (20N to 70N).

Anomalies are with respect to 1901-2000. period is July 1891 to June 2005. The CRU (HadCRU) curves are supposed to be black.

No data has been masked by another dataset's observational availability, but missing values are not included in that dataset's area-weighted average.

Your ERA-Interim finding about it being warmer seems to be the case in the late 19th century but not the early 1920's.

Note that the only thermometer data in the magenta curve (20CRv2) is the HadISST1.1 over oceans. The two landonly panels are independent of thermometers, aside from the specified SSTs.

There are some very interesting differences, particularly late-19th century, 1920s, and WWII.

Correlations (I told you this was research, right?). The second pair is for linearly detrended data.

I thought that correlations of 0.8 to 0.85 were high for an independent dataset this long. I think that these are higher than the proxies?

The global isn't that fair because we have the HadISST.

The correlations are about the same as for AMIP runs, though. See

Hoerling M., A. Kumar, J. Eischeid, B. Jha (2008), What is causing the variability in global mean land temperature?, Geophys. Res. Lett., 35, L23712, doi:10.1029/2008GL035984.

It will be interesting to see if the masked numbers change.

Let me know if you need anything else on this for your essay material.

best wishes,

gil

Phil Jones wrote on 11/9/09 2:55 AM:

Gil,

A couple of questions.

1. See the attached. Is this paper providing the SST input to 20CRv2?
2. Do you change greenhouse gases in the run?

Apologies if these are answered elsewhere.

Do you have any pre-draft plots without subsampling to get some idea of how good the agreement?

I'm asking these questions as I'm writing an essay for Climate Change. There are no diagrams in this, but showing the agreement with 20CRv2 will be a nice way to finish the paper.

Paper briefly documents the magnitude of all the problems in global temperature data - such as SST biases, exposure issues, urbanization and site changes (in order of importance). Site changes for global averages are the least important. Trying to point to a few home truths to skeptics who keep on going on about the land data.

Cheers

Phil

At 15:39 03/11/2009, Gil Compo wrote:

Phil,

Already calculated. We don't suffer from some of the issues that you and Adrian raised because we use only surface pressure.

In the Northern Hemisphere extratropics, the agreement with the various (yours, GISTEMP, NOAA) thermometer-based near surface T is high, but in the Tropics and Southern Hemisphere, there are discrepancies, particularly over Africa and South America. The 20CRv2 does not have the intensity of the Siberia warming.

There are also discrepancies in the WWII period. I have not subset the reanalysis to correspond to a particular dataset's missing mask as all 3 have different coverages.

I'll be making plots for the paper (with a draft coming) soon.

best wishes,

gil

[2]P.Jones@uea.ac.uk wrote on 11/3/09 3:37 AM:

Gil,

I'm sitting in a meeting in Bristol with Rob Allan. We've had a thought. When you finish v2 will you be quickly calculating the global T average for the 1891-2006 period? Do you expect this to look like the real global T, or do you expect it to not show the longer timescale change that NCEP from 1948 showed?

I can send a paper with Adrian Simmons from JGR in 2004 on this when I'm back in Norwich tomorrow.

Cheers

Phil

Dear Colleagues,

Courtesy of the NOAA Earth System Research Laboratory Physical Sciences Division and University of Colorado CIRES Climate Diagnostics Center, at

[3]ftp://ftp.cdc.noaa.gov/Datasets/20thC_Rean/provisionalV2/ , please find temporary netCDF files from the 20th Century Reanalysis version 2 (1891-2006). These yearly files are for the ensemble mean analysis (means) and ensemble standard deviation (spreads) of selected variables. Colleagues from organizations contributing to the 20th Century Reanalysis version 2 or the International Surface Pressure Databank version 2.2, the observational input dataset, are welcome to investigate these preliminary files. Colleagues on the Atmospheric Circulation Reconstructions over the Earth Working Group 3 Verification and Validation of reanalyses are also welcome to begin working with these files.

We are working with our distribution partners at the National Center for Atmospheric Research, the National Oceanic and Atmospheric Administration (NOAA) Earth System Research Laboratory and NOAAs National Climatic Data Center on wider availability and documentation.

A rough draft of important documentation is attached.

Also, please see our new homepage at

[4]http://www.esrl.noaa.gov/psd/data/20thC_Rean/ which includes access to images of 6-hourly sea level pressure and 500 geopotential maps generated from the version 2 data.

When production is complete, the 20CR version 2 will span 1871 to present.

The references for the dataset are

From: AGU Atmospheric Sciences Section <Section@AGU.ORG>
To: <AS-SECTION_D@listserv.agu.org>
Subject: Letter to Atmospheric Sciences members
Date: Tue, 10 Nov 2009 14:23:32 -0500
Reply-to: AGU Atmospheric Sciences Section <Section@AGU.ORG>

Dear Atmospheric Sciences Section members,

First, I would like to remind you of three very close deadlines:

Nov. 12, Discounted registration for AGU Fall Meeting. Register at [1]https://www.associationsciences.org/agu/meet_demog.jsp, and sign up for our Atmospheric Sciences banquet on Dec. 15.

Nov. 13, Vote yes on AGU governance changes, [2]<http://www.agu.org/governancevote/>

Nov. 13, Please respond to [3]stacyjackson@berkeley.edu if you are willing to volunteer your expertise to help answer questions during the Copenhagen Conference of the Parties of the Framework Convention on Climate Change (see below).

Second, I would like to give you some information about where your contributions to AGU go. Last year, members of the Atmospheric Sciences Section contributed \$43,410 to AGU's Voluntary Contribution Campaign. In 2008, due largely to member donations like these, AGU facilitated career development events attended by 600 students, hosted 75 K-12 teachers at Fall Meeting workshops, and sponsored 31 members' visits with U.S. policy makers. Additionally, voluntary contributions allowed AGU to provide travel grants to 135 deserving students to present their research for the first time at an AGU meeting. These programs are essential for AGU's relevance and vitality. I know Atmospheric Science members want AGU to do more. Please join me in supporting AGU's efforts to strengthen our scientific society by making a gift to the 2010 Voluntary Contribution Campaign. Unrestricted contributions are used to support AGU's greatest needs, but you can directly support students pursuing Atmospheric Sciences by making a gift to the David Hofmann Travel Grant, Holton-Kaufman Grant, or Namias Travel Grant. You can make your gift when you renew your AGU membership, or you can give today at:

[4]https://www.agu.org/givingtoagu/making_your_gift.php

Sincerely,

Alan Robock

President, Atmospheric Sciences Section, AGU [5]robock@envsci.rutgers.edu

AGU Climate Scientists,

We are writing to encourage hundreds of you to participate in a unique opportunity to improve the public's climate knowledge during the week before and the week of this year's AGU Fall Meeting.

As you know, the Copenhagen negotiations (Dec. 7-18) are attracting hundreds of journalists and will result in a proliferation of media articles about climate change. Recently, the American public's "belief" in climate change has waned (36% think humans are warming the earth according to the Pew Center's October poll), and December's media blitz provides an opportunity to reverse the trend.

Your participation is needed to ensure that climate science coverage across media channels is accurate, fact-based, and nuanced. Provided that enough AGU members sign up to participate, we will be offering the opportunity for journalists reporting during the Copenhagen conference to submit their questions on-line and receive a response from a climate expert before an article goes to press.

We are asking each of you to sign up for two hours over the course of those two weeks (12/7-18) to respond to questions from journalists. You will be able to choose which queries to answer based on your expertise, and there will be an option to double-team when questions span multiple areas of expertise. We will be setting up the appropriate logistics to enable both virtual participation and a central work area at the AGU meeting. If you have any questions, feel free to email Stacy Jackson at the email address below.

If you are willing to participate, please respond in the affirmative by Friday November 13th to [6]stacyjackson@berkeley.edu. Given the magnitude of the media coverage, we are seeking several hundred willing climate scientists. More details will be forthcoming.

Thanks in advance,

Alan Robock, President, AGU Atmospheric Sciences Section

Anne Thompson, President-Elect, AGU Atmospheric Sciences Section

Subject: Helpdesk query 1489: Hourly data have discontinuities at day joins

Hi Chris,

Another Weather Generator query for you. It was raised by Richard Watkins of Manchester University (and COPSE project) following a visit from Roger yesterday.

Can you let me know your response please?

Cheers,
Lyndsey

Long Description=The hourly data from the Weather

Generator have discontinuities at each

midnight join. The e.g. temperature

jumps, may be as high as $9\frac{1}{2}^{\circ}\text{C}$. The

hourly data seem to have been generated

independently for each day, rather than

fitting a curve from the maximum of one

day to the minimum of the next. The

minimum to maximum curve, i.e. within

each day, is fine.

Could the Weather Generator be altered

to produce more realistic hourly data

by fitting from Tmax to Tmin the

following day, please? This would be

helpful particularly for any use of the

data for building simulation with plant

controls.

Thanks,

Richard Watkins

From: Phil Jones <p.jones@uea.ac.uk>
To: Sandy Tudhope <sandy.tudhope@ed.ac.uk>
Subject: Latest draft of WPI
Date: Thu Nov 12 10:18:54 2009
Cc: "Wolff, Eric W" <ewwo@bas.ac.uk>, Rob Wilson <rjsw@st-andrews.ac.uk>, "Bass, Catherine" <C.J.Bass@exeter.ac.uk>, "Turney, Christian" <C.Turney@exeter.ac.uk>, Rob Allan <rob.allan@metoffice.gov.uk>, Keith Briffa <k.briffa@uea.ac.uk>, "t.osborn@uea.ac.uk" <t.osborn@uea.ac.uk>

Dear All (especially Chris/Catherine),

Here's the latest draft of WPI. All in the group have now commented and amended this. You should have the 3 supporting letters from Tree partners. Eric was contacting Eric Steig and Sandy (see below) is contacting 3 coral people.

There is an issue about a Map. Rob W put one in his PhD page. This shows the corals. If we were to add the tree-ring sites we would mainly get a splodge of points in South America and NZ. Ice cores would just be over the AP and in the low-lat Andes. Issue is one of space. We already have 3pp fo this WP. Refs will reduce to about 0.5pp once we go to et al for 3 or more authors. A map would be useful for presentation to NERC, but is it essential for the submission?

I'm away from tomorrow lunchtime for the weekend. Back in on Monday. Hope we'll be looking through more complete drafts next week!

Cheers

Phil

At 19:02 11/11/2009, Sandy Tudhope wrote:

Dear Phil et al,

Good to speak to you earlier Phil and Rob W..

Please find attached a slightly modified version for WPI ... I've just changed the coral section a bit. Briefly, I've identified the new coral coring sites (rather than get bogged down trying to describe how we will use analysis of model output to prioritise), plus I've added back in some references and details that I think help, but don't add too much length.

I've written to Janice Lough, Julie Cole and Kim Cobb re being Project Partners (I actually spoke to Kim and she is keen).

FIGURE: I still think it might be useful to have a map in the main proposal ... basically like the one Rob has in the PhD proposal ... we can simply have boxes around the tree ring and ice core regions. This map needn't be any larger than Rob already has it ... but it does help illustrate where we will get/have data. What do you all think?

Cheers,

Sandy

Subject: Letter draft
Date: Thu, 12 Nov 2009 14:17:44 -0000

Phil, attached is a draft letter. We were keen to keep it as short, sweet and uncomplicated as possible without skipping over important details. Shorter, simpler, requests are more likely to get read and acted upon was the specific advice from international relations.
