```
# Some model setup informations:
# -----
# All runs with horizontal/vertical diffusion
#
# Run with standard ocean parameters
#   as used in Plattner et al. 2001/2002
#   with Kv (diffusivity) 4*10^-5 m2/s
#
# Climate sens. set to ~ 3.2 degrees C
# parameterized see Knutti et al. (Clim. Dyn. 2003)
#
# Model version is annual mean.
#
# No radiation code, CO2 radiative forcing calculated
# for as RF=5.35*ln(CO2/CO2_preind),
# Non-co2 radiative forcing prescribed according to
# Joos et al. GBC 2001 with updates for solar forcing
#
# More model description:

<x-flowed>

Dear Eystein and Peck,

sorry for the overlong silence at this end. We **are** working on the revised figures, etc. and thanks for the CLIMBER and BERN EMIC data - Keith and I must look at this and see how best to show it.

In the meantime, I just wanted to forward to you a paper that we have coming out in Science next Friday - see the **uncorrected** page proofs attached. Please treat this in confidence and for IPCC purposes only - I'm sure you're aware of their strict embargo policy.

The reason we thought it worth forwarding was because it is useful for comparing implied MWP and 20th century NH temperatures and thus might be appropriate for use in the IPCC "MWP box". The approach is similar to that which Susan Solomon seemed to be keen on - looking at individual series, but simply counting how many simultaneously imply warmth or cold conditions. There's also the possibility that one of its figures (perhaps panel 3B) might be useful in the "MWP box". If you have time for a quick read, please tell us what you think.

Eystein - you were also wanting some regional proxy series and I thought I'd send you the data shown in Fig 1 of this paper, because I'm preparing a file to accompany the paper anyway and this will kill two birds with one stone. Are these data what you were hoping for? I'll send them later today if they are.

Cheers

Tim

Peck and Eystein

we are having trouble to express the real message of the reconstructions - being scientifically sound in representing uncertainty, while still getting the crux of the information across clearly. It is not right to ignore uncertainty, but expressing this merely in an arbitrary way (and as a total range as before) allows the uncertainty to swamp the magnitude of the changes through time. We have settled on this version (attached) of the Figure which we hope you will agree gets the message over but with the rigor required for such an important document.

We have added a box to show the "probability surface" for the most likely estimate of past temperatures based on all published data. By overlapping all reconstructions and giving a score of 2 to all areas within the 1 standard error range of the estimates for each reconstruction, and a score of 1 for the area between 1 and 2 standard errors, you build up a composite picture of the most likely or "consensus" path that temperatures took over the last 1200 years (note - now with a linear time axis). This still shows the outlier ranges, preserving all the information, but you see the central most likely area well, and the comparison of past and recent temperature levels is not as influenced by the outlier estimates. What do you think? We have experimented with different versions of the shading and this one shows up quite well - but we may have to use some all grey version as the background to the overlay of the model results.

We have also experimented with changing the normalisation base for the model/reconstruction Figure, but using the same short modern period as for the first Figure is not satisfactory - more on this later. We have added in Oerlemans curve as many insisted - but we only have the GLOBAL curve - can you get the separate North and Southern Hemisphere curves (with uncertainty). I do not see that the new model runs from Germany/Switzerland will fit easily in the existing Figure and need to be separate! I am really struggling with the text also - really need more time!!!! More later

Keith

can you also check that Fortunat is addressing the few comments (ie revising the text) that relate to his bit of my section and Henry Pollack is helping us to asses the comments and revise the text to do with the Ground Surface Temperature section. I presume Ricardo and Peck are dealing with all the regional stuff. Thanks

At 17:32 03/02/2006, you wrote:

Hi,

I can contact Oerlemans, have met him a few times.

Cheers,
Eystein

thanks for this - the new runs I think best in a separate panel .

Keith

At 16:44 03/02/2006, Jonathan Overpeck wrote:

Hi Keith and Tim (and Eystein): Your new figure is quite compelling, and a nice complement to the other two panels. I agree it would be good to get the Northern Hem Oerleman's plot - Eystein do you know him well enough to ask? (I never even met him, but could ask if you don't know him).

What you have created will take some good work on the caption to explain, but it has my vote.

What is your plan for dealing with the new German/Swiss model results? A new figure? Are you sure these runs can't be worked in, perhaps as a new panel? At least we have Susan's support for the new runs, so we do what we have to do.

As for work and time, we are running out. Just do the best you can, and hopefully the new section will emerge sometime next week.

Highest priority (please do first) - we need 3 TS-contender figures (and captions) by early next week:

- 1) the new fig showing all the sites used in the recons - with caption
- 2) the fig you've attached to this email - with caption (were we going to try to put all the model runs/refs/color key into a table, so the caption could be shorter than in the FOD? Think this would be better, so caption is shorter)
- 3) the new fig comparing the obs to the model runs (update of the fig we showed for first time in ChCh - using a version of the lower panel you attached to this email - with caption

There is little doubt you guys have the hardest job of all LAs in our chapter, and

possibly the entire WG1 report. Your work will have huge impact, and the extra effort is really appreciated well beyond me and Eystein. I wish we could offer up a time machine to make it easier, but... just keep plugging.

thanks! Peck

Peck and Eystein

we are having trouble to express the real message of the reconstructions - being scientifically sound in representing uncertainty, while still getting the crux of the information across clearly. Dear Eystein and Peck,

Many thanks for your reply and contribution for the glacier box. Everything is fine with me except for the sentence:

"Comparing the ongoing retreat of glaciers with the reconstructed records, it is evident that the current global pattern is unprecedented within the Holocene, as there is no known period with a global homogenous trend of retreating glaciers over centennial and shorter timescales."

The reason of my disagreement is the following: the resolution and the spatial and temporal coverage of the Holocene glacial records is not enough to compare it seriously at the century level. For most of regions we even cannot estimate the synchronicity of the records. Looking at the figure a reader will see that there was actually a period with "a global homogenous trend of retreating glaciers" during at least a millennium (at least 7000-8000 bp) - not a century like now! To resolve this problem we can discuss in a broader audience and ask the opinion of more experts if you wish - I can think of Luckman, Nesje, Grove, Porter, Karlen.

I corrected a little the second paragraph - removed three references - they are not used in our picture and, in fact not that good in terms of real reconstructions. I think we should stress clearly that the records from Scandinavia is now the most reliable and detailed.

Regards,

olga

Dear Olga,
both Peck and I like the new version, both figure and shorter text.
Please find enclosed a suggestion from us with
some revisions, one file with track changes, one
with all changes accepted. I have added a little
to your short text, but not much. If you are
happy with this, please send the final version
inserted into the template of the SOD we sent out
so that the style is correct, the figure
separately, and an endnote file with references.
Best wishes and thanks for all your efforts,
Eystein

My view is that paleo is not important enough for the Hadley Centre for us to spend much (or any) time helping Millennium unless there is some cash on the table to buy some staff time. I am working 75% at the moment so need to focus on staff management. If I do have time it will be focused on completing the SOAP work.

Hi Eystein and Peck,

sorry, but I'm **still** working on the figures. On the simulations one, we were requested to include results from the new Stendel et al. (2005, Clim. Dyn.) simulation with ECHAM4-OPYC3 for the last 500 years. Did you get these data already? I've just emailed Martin Stendel to ask for them, but thought I'd check in case you already had them.

Cheers

Tim

Hi Eystein, Keith and Tim - this seems odd to me, given that the N hem data must completely dominate his global recon. BUT, since the data and recon are his, and our job is to assess what is published, we don't have much choice. We have three options (or more if you can think of them):

option 1) forget about his recon. Although I sense that there might be some interest in this, we must include his study/data/fig

option 2) we could make a separate fig to highlight just his global recon, perhaps compared to the global borehole recon. We are dying for space, so I suspect this option isn't ideal either. Expert review of the SOD might suggest it, but in the meantime, I suggest we try to get away with...

option 3) we include it in the big recon plot, and just make it clear in the caption (and table that goes with the caption if you're going with the table idea) that the Oerleman's curve, though labeled global in the original paper, appears to be representative of (or weighted mostly by, or ?) glaciers in the Northern Hemisphere (per his Fig 3a). I think we should leave it to Keith and Tim to figure out the best language, but I think this will work. Could be done as a footnote to the table instead of the caption.

Make sense? thanks, Peck

Tim - thanks for the update. Just think of the beer at the end of the tunnel. This week's deadline is a TSU deadline for figs being considered for the Tech Summary. You're looking good to get some of your figs/science in the TS, and this means big impact. Hopefully, provides the extra juice to find the extra time needed to get them done.

thx, peck

From: Jesus Fidel Gonzalez Rouco <fidelgr@fis.ucm.es>
To: t.osborn@uea.ac.uk
Subject: Re: erik2
Date: Wed, 08 Feb 2006 18:34:25 +0100
Cc: k briffa <k.briffa@uea.ac.uk>

Dear Tim,

attach the data (erikII.dat): NH averages with standard latitude weighting.

Yes, the forced simulations are identical in forcing, just different initial conditions.

Just for complementary info on the data file a rough plot of the data in the file erikII.dat in comparison with NH avgs in ErikI: ErikI-II.ps

Also for commplementary info, I attach nhavg.jpg and nhano.jpg...plots of anomalies and absolute values in the NH for all the forced runs:

columbus erikI,II and control.

Let me know if there are any queries or problems.

Best regards

Fidel

ps.- I will be glad to have a pdf of the magicc paper when you consider it appropriate.

Congratulations for this.

Tim Osborn wrote:

Hi again Fidel,

we are in the very final stages of preparing a revised figure for the IPCC and so your email has come at just the right time (if you can provide the data quickly). Assuming the forcings are identical to erik1, then all we would need is a time series (in plain text) of annual-mean NH temperature.

If you can provide this, then we can include it. (My paper comparing erik1 against a simulation with the simple energy balance model MAGICC has at last been accepted by Climate Dynamics - there were no problems at all, just very slow reviewers and very slow editorial decisions!).

Best wishes

Tim

On Mon, February 6, 2006 8:37 pm, Jesus Fidel Gonzalez Rouco wrote:

Dear Tim and Keith,

the erik2 paper which I mentioned in Bern was under review came out some weeks ago.

You mentioned then that it might be of interest to include these data in the IPCC rep. Let me know what you need for this when it suits you.

I attach the pdf.

Thanks a lot for that btw.

Best regards from Madrid

Fidel

Guys,

A final revised version attached. I'm expecting the embargo to lift at midnight east coast U.S., but let me know if you hear otherwise. I will make sure the science website has posted the paper before posting myself...

Hi Keith and Tim - Eystein and I just talked about Henry's request to be able to read and comment on your SOD text, and it seems highly appropriate that we work super hard to make this possible. It is taking place w/ other sections of the SOD, and your section is the one that has to be the most perfect.

I'm guessing that we'll have final figs this week or over the weekend (please!), and the edited section a day or two later (at the most). As per the last email to you and Henry, you can save everyone time if you send sections relevant to him (all the multi-proxy and proxy sections) as soon as they are done.

Sorry to keep the pressure on, but we are running out of time.

thanks, peck

guys, I see that Science has already gone online w/ the new issue, so we put up the RC post. By now, you've probably read that nasty McIntyre thing. Apparently, he violated the embargo on his website (I don't go there personally, but so I'm informed).

Anyway, I wanted you guys to know that you're free to use RC in any way you think would be helpful. Gavin and I are going to be careful about what comments we screen through, and we'll be very careful to answer any questions that come up to any extent we can. On the other hand, you might want to visit the thread and post replies yourself. We can hold comments up in the queue and contact you about whether or not you think they should be screened through or not, and if so, any comments you'd like us to include.

You're also welcome to do a followup guest post, etc. think of RC as a resource that is at your disposal to combat any disinformation put forward by the McIntyres of the world. Just let us know. We'll use our best discretion to make sure the skeptics don't get to use the RC comments as a megaphone...

Hi Eugene - this is good news... I hope. Please contact Steve and see if we will have "in press" status before the end of the month. He knows the drill, but also the downside of not being precise. Let me, Eystein and Keith know as soon as you know. Bit nuts right now, really appreciate your help.

thanks, peck

<x-flowed>

Hi Stefan and Fortunat: Attached are the draft figs that include proxy obs, simulations, and comparisons of the two. As you can see, Tim just sent them. Big job, but they look great in my eyes.

See Tim's email below for more background info.

We need fast feedback from you both, specifically:

- 1) any general comments on the figs - this is a crux set of figures and we need your eyes to look at them carefully
- 2) is it wise to keep the new EMIC run panel attached to the second figure as attached? I vote yes, but what do you think. It fits w/ the other panels pretty well.
- 3) either way, we need caption prose from you (perhaps Fortunat start, and Stefan edit, or vice versa if Stefan can start first) on the new EMIC panel.
- 4) also, we need a new para, or prose that can be added to a para, that describes the panel and it's implications as it informs our assessment. Keith will then integrate this into the section. I'm not sure of this, but perhaps you could start with a new question heading, and then have a short para to go under it - something like "What is the significance of the new reduced-amplitude estimates of past solar variability?"

Of course, we need your feedback and prose asap. Please send to me, Eystein, Keith and Tim.

Thanks in advance for the help. Best, peck

>the attached word file contains the latest versions of two of our figures.
>
>First, is the reconstructions with many requests now done: linear time scale, dotted early instrumental temperatures not solid line, Oerlemans added, new panel showing shading for the overlapping regions of temperature reconstructions.
>
>Second, is the forcings and models. Stendel ECHAM simulation added (1500-2000). New ECHO-G Erik2 simulation just published in GRL from Gonzalez-Ruoco et al. added (1000-1990). Reconstruction "envelope" replaced by new shading of overlaps in the temperature reconstructions. Correction of some labelling errors. Those runs that did not include 20th century sulphate aerosol cooling are dotted or dashed after 1900 (the two low ones also omitted CH4, N2O, CFCs, O3, hence still cool despite omitting aerosol cooling). The ECHO-G Erik1 simulation with the very out-of-equilibrium initial conditions is dashed. Finally, the extra panel with the new EMIC runs is included as panel (e), again with the new shading of overlapping temperature reconstructions.

Keith - figs look great for now, and hopefully the flurry of emails just cc'd to you will take care of everything except Oerlemans. To help here, I've dug up the Chap 4 pdfs. (going to the CLA would not be quick, nor necessarily any better).

In the Ch04 figs file, go to Fig 4.5.4 on pg 4-72 for caption material that seems pretty bland.

In the Ch04 Text file, go to first full para on p 4-22 for what chap 4 had on the Oerleman's work. I suspect this is the last time they thought about it.

You can keep this really short and sweet - main thing is that it's another independent data set that shows unprecedented recent warming. A short para should do it.

Are you going to use a table to help with the figure captions?

On the weekend/evenings, I can be reached at home 1-970-728-0780, and during the week on my cell 520-907-6480. I'm single parenting, so on the weekends and evenings I might have to call back if 4 yr old Jack is doing something less than enjoyable to 1 yr old Eli. Julie is in Germany for IODP sampling. During the week, the boys are in school, and Julie's Mom arrives in time for next weekend. After the boys go to bed, I also work.

We're getting there - thanks!

best, peck

Hi Tim - it is a wonderful figure, and we are writing about a paper's worth about it - very condensed stuff, but loaded with impact.

Let's see what Keith and Eystein suggest, but I'm happy w/ the fig and ref period you've used. Would rather have you working on more award winning figs than updating this one. Can do that later depending on feedback the SOD gets.

Well done, thx, peck

Hi again Peck,

sorry, forgot about the raw volcanic series. Originally I had it as a separate panel - yes! yet another panel! - but then I tried underlaying it on the smoothed series in a pale grey. Please see attached files (pdf and gif of the model/forcing figure). What do you think? Is it too distracting to have these grey spikes? Also note that they are on the same scale as the rest of the forcings and unfortunately some spikes are truncated at the bottom of the forcings panel - especially 1259 event. This particular series I've used is from Ammann and you can see the link between the spikes and the smoothed green-colour volcanic curve.

Finally, note that this is just panels A-D. If you like this version, then you can insert it into the Word file I sent before, in place of panels A-D (use the gif file for this purpose). You'll see that panel E is a separate piece of figure, and can stay unchanged in the Word file. Hope you follow this bit.

PS. Keith hasn't seen this version - not sure what his views are on the distraction of the grey spikes!

Must go now,

Tim

Hi Keith,

I'm pretty sure they're just asking for a neutral discussion of the science that you've done that is relevant to the issues being reviewed by the committee (after all this is the U.S. National Academy of Sciences, not the U.S. Senate, etc). But I understand where you're coming from nonetheless. Perhaps you could suggest an alternate? Any possibility Tim could do this instead? He's less intimately involved w/ the paleo chapter of IPCC, so I think it might be less of a worry for him? Or Phil? Its your prerogative to suggest alternates, and I think they'll take your suggestions very seriously. My greatest fear is that McIntyre dominates the discussion. Its important that they hear from the legitimate scientists.

Thanks,

mike

Dear all,

here is the data from the Climber-3alpha simulations. I know they are too late, but perhaps there is still a way to include them. The structure of the files is the same as Eva's. The file names correspond to the ones you gave in the simulation protocol.

Cheers,
Anders

<x-flowed>

Hi Henry (and Keith) - thanks for the quick effort! Regarding your comments, here's some feedback - it's good Keith beat me too it.

1. For Fig. 6.9b, there is a new version that resulted in lots of discussion at our last meeting. Keith can elaborate when he has time (we're pushing him real hard now for the SOD text), but we agree the caption has to be clear.
2. I'm worried about your discussion of southern hemisphere records, and trust Keith will get it right. Too bad your paper isn't in press too - it would be nice to include.
3. Hope you can help Keith with uncertainty prose. We are over length and hence we can't have more figures (e.g., with confidence intervals shown for all data). Please help him work it into the SOD text.
4. It is unclear if we'll have time for review of the whole chapter, but I'm still hoping Keith will send you all of Section 6.6 to look at. That assumes he has it done today or very soon at least. The more people that can look at text the better, but we also have to get the draft done - it can then be reviewed, and we will make sure CAs get to review in a more timely fashion this time.

Thanks again, Peck

Hi Tim,

Thanks, I agree. I don't think there is any need for you/Keith to do this. We've pretty much got things under control at RC and it is probably wise to hold your ammunition for any possible comment to Science. In my view the McIntyre criticisms are weak and disingenuous. But what's new w/ that?

Hi all - I commented on the reference period issue in my previous email, and hope we can resolve it today, or tomorrow at the latest? Tim and Keith should help convince Fortunat that their choice is strong.

Tim - can you make the other changes suggested by Fortunat?

Thanks, peck

Dear Prof. Jones

My name is Andras Vag, I am working for a Hungarian organization (ATLAS Innoglobe), which deals with environmental consultancy.

We are preparing an EU project proposal for the following call: Scientific Support to Policies, Identifier: [FP6-2005-SSP-5-A] Budget: 77 million

Closing Date(s): 22 March 2006 at 17.00 (Brussels local time)

Specific programme: [Integrating and Strengthening the European Research Area] ,
Activity area(s): [Policy-orientated research]

[1]http://fp6.cordis.europa.eu.int/index.cfm?fuseaction=UserSite.FP6DetailsCallPage&call_id=268

Are you / CRU is interested in the cooperation? The co-work with you would be a great honour for us and definitely would improve the quality of the project.

Please see the attached Letter of Invitation to the planned project. I hope you like the idea.

Best wishes

O.k. EMIC caption noted. Can go with the 1500-1899 ref period.

Stefan, Anders, and Eva can you provide me the appropriate references for your models and the official names.

Regards, Fortunat

<x-flowed>

Hi Keith (and Eystein - we need your opinion) - thanks for the quick response. I think it easier (imagining the mess of email that could result) if we focus on one bullet/email. So I'll start w/ the first, and hope that Eystein can also weigh in.

With regard to the first one below, I agree that we can leave statistics out of it. Good point.

But, I think we must at least address Susan's concern. To do otherwise would be counterproductive. She makes sense. I think your MWP results is quite appropriate - they were published in Science, and in my reading of the paper, you are convincing. If it's in the chapter, it makes sense to draw on it for the exec summary. Please defend more convincingly, or suggest an alternative way to deal with Susan's concern - what is the significance (not statistical) of this one record being warmer? We need to say it.

If you really want to leave as is, please write your response in a way that I can forward to Susan - we can't ignore the comment in this case, because other (me, at least) think it makes sense. So we have to convince her too - this is big stuff for the AR4, and will be in the TS/SPM. We can't be as vague as the current bullet is.

And as for the MWP box fig, I think it should be as you suggest - combine the existing fig w/ the new one from Tim and your paper. I think Tim might already be working on it?

Sorry to be a tough guy, but this bullet needs to be more clear.

Thanks, peck

thanks. Agree on the attribution front, but what about being more specific (at least a little) about what the "subsequent evidence" is. Is there really anything new that gives us more confidence?

Keith? Eystein?

thx, peck

Hi,

I think this version of bullet two is best:

- o The TAR pointed to the "exceptional warmth of the late 20th century, relative to the past 1000 years". Subsequent evidence reinforces this conclusion. Indeed, it is very likely that average Northern Hemisphere temperatures during the second half of the 20th century were warmer than any other 50-year period in the last 500 years. It is also likely that this was the warmest period in the past 1300 years. The uneven coverage and characteristics of the proxy data mean that these conclusions are most robust over summer, extra-tropical, land areas.

I agree with Keith we cannot enter into the attribution aspects that Susan alludes to.

Eystein

At 11:57 -0700 15-02-06, Jonathan Overpeck wrote:

Hi again - as for bullet issue number 2, I agree that we don't need to go with the suggest stuff on solar/forcing, BUT, I agree w/ Susan that we should try to put more in the bullet about "Subsequent evidence" Would you pls send a new bullet that has your suggested changes below, and that includes something like:

"Subsequent evidence, including x, y and z, reinforces this conclusion." Need to convince readers that there really has been an increase in knowledge - more evidence. What is it? The bullet can be longer if needed.

Thanks, Peck

Second

Simply make "1000" "1300 years. " and delete "and unusually warm compared with the last 2000 years."

It is certainly NOT our job to be discussing attribution in the 20th century - this is Chapter 9 - and we had no room (or any published material) to allow a discussion of relative forcing contributions in earlier time. Therefore a vague statement about "perhaps due to solar forcing" seems unjustified.

Third

I suggest this should be

Taken together , the sparse evidence of Southern Hemisphere temperatures prior to the period of instrumental records indicates that overall warming has occurred during the last 350 years, but the even fewer longer regional records indicate earlier periods that are as warm, or warmer than, 20th century means.

Fourth

fine , though perhaps "warmth" instead of "warming"?
and need to see EMIC text

Fifth

suggest delete

Sixth

suggest delete

Peck, you have to consider that since the TAR , there has been a lot of argument re "hockey stick" and the real independence of the inputs to most subsequent analyses is minimal. True, there have been many different techniques used to aggregate and scale data - but the efficacy of these is still far from established. We should be careful not to push the conclusions beyond what we can securely justify - and this is not much other than a confirmation of the general conclusions of the TAR . We must resist being pushed to present the results such that we will be accused of bias - hence no need to attack Moberg . Just need to show the "most likely" course of temperatures over the last 1300 years - which we do well I think. Strong confirmation of TAR is a good result, given that we discuss uncertainty and base it on more data. Let us not try to over egg the pudding.

For what it worth , the above comments are my (honestly long considered) views - and I would not be happy to go further . Of course this discussion now needs to go to the wider Chapter authorship, but do not let Susan (or Mike) push you (us) beyond where we know is right.

<x-flowed>

Dear Peck and Eystein

I have to come back again on this.

FIRST

Happy with first sentence.

Then following largely on a suggestion made by Tim , I suggest

The additional variability implies mainly cooler temperatures (predominantly in the 12th-14th, 17th and 19th centuries) and only one new reconstruction suggests slightly warmer conditions (in the 11th century), but well within the uncertainty range indicated in the TAR.

Failing this, I suggest we omit everything after the first closing bracket.

SECOND

Now suggest insert the bit about our work (Tim and I) in the second point - after the sentence ending "1300 years." That is..

The regional extent of Northern Hemisphere warmth was very likely greater during the 20th century than in any other century during the last 1300 years.

Will finish corrections to my text tomorrow - but hope Fortunat has checked it all, and is doing a paragraph on the EMICS still?

cheers

Keith

Hi Keith and Eystein - good additions. Thanks. You can see how I edited them in the attached. The only tough issue was Eystein's proposed key uncertainty on ocean circulation. I think it would be awkward to have multiple abrupt change uncertainties listed (our list is already pretty long in general), so I combined your suggested bullet w/ the existing one (to include drought and other types of abrupt change:

"The mechanisms of abrupt climate change (for example, in ocean circulation and drought frequency) are not well understood, nor are the key climate thresholds that, when crossed, could trigger an acceleration in regional climate change."

If either of you thinks we can improve further, pls track changes edit the attached.

Thanks again, Peck

Hi Eystein, Keith and Fortunat - this is a special request for help from the Euro team, so I know I have solid feedback by the time I get to work tomorrow am. Please respond asap (using track changes if you can).

1) Tomorrow I have to send the TSU our Robust Findings and Key Uncertainties Table. I have attached this table. Please edit, and if you think a Finding or Uncertainty is missing, please suggest exactly how you think it should be worded, and, if it is a Finding, suggest which existing one it should replace (I suspect they don't want more, but we could try). Please keep in mind this table will be part of the TS (not our chapter), and they must be VERY policy relevant - this is not the place for things a policy maker would not understand. Also, we need to use plainer English than in our Exec Summary bullets.

2) I also attach the latest Exec Summary, with the latest from Keith and Fortunat (e.g., reordered as you suggested). I will send this in to the TSU tomorrow too, so if you want to read and edit (PLEASE USE TRACK CHANGES), that'll help too, but this is less important than working on the Robust/Key table.

Many thanks! Cheers, peck

Subject: Re: Figures - urgent

Date: Fri, 17 Feb 2006 17:00:44 +0000

<x-flowed>

Hi Peck and Eystein,

just working on this MWP box fig update. Just trying to clarify what is wanted.

The old MWP box fig had 8 series on it. 7 of these were straight from our recent Science paper anyway, and the 8th was the average of 2 more from the Science paper. The other 5 in the paper (making a total of $7+2+5 = 14$ series) were not used in the old MWP box fig, as they are too short to cover the MWP period.

(1) Are you asking me to use exactly the 14 series from the Science paper, overlaid like in the old MWP fig or, if space permits, plotted like fig 1 in our Science paper. And then add below the exact fig 3B of our paper (you say "3b-like" which implied maybe some changes).

(2) Or do you want to stick with the original 8 series, and then have the exact fig 3B from our paper, which wouldn't correspond exactly to the 8 series above because it would be based on the 14.

(3) Or do you want to stick with the original 8 series, and then show a panel similar to our fig 3B, but *recalculated* using just the 8 series shown?

So many questions! ;-)

I attached the original MWP fig (8 series), plus a new one from option (1) above (14 series, looks a bit of a mess, also I removed the "composite mean" which might have been agreed in New Zealand?).

Cheers

Tim

Cc: ""@kup.unibe.ch

Hi,

Robust finding/uncertainty table is fine with me. Good job!

Here the 6.6 material from Bern. It includes an update on solar forcing, an update on the section on compatibility of the GHG-proxz-forcing records, new text for the sulfate aerosol figure, new text for the EMIC figure panel e) and a proposed bullet for the last millennium modeling.

Will send an update of the ice core sulfate figure next week with one additional curve from Antarctica and an updated figure caption. Otherwise, I think this is all you need from me for 6.6. Will also hunt recent references for alpine cores highlighted as missing.

Let me know if I missed something else for the last 2ka section.

- The solar subsection in 6.6.3 requires coordination with chapter 2 – Suggest to send the text to Dorland and Lean as soon as agreed among us. Note that we do not have an exec summary bullet on solar forcing – probably captured by chap 2
- should probably also send the para on sulfate aerosols to chap 2 for checking consistency and cross-referencing
- Have tried to be brief and not to add much, have also suggested to delete paragraphs.
- note new bullet proposed for exec summary on model results. Would be nice if sufficient space, but no strong feeling whether this should be included or not; may be covered to some extent by the attribution chapter.

KEITH:

Can you or Tim please provide the number for the smoothing shown in figure 11e: 'The simulated range in decadal-smoothed NH surface temperature is about 60% KEITH/TIM CAN YOU CHECK/PROVIDE THIS NUMBER WITH YOUR FILTERED DATA larger for the high amplitude than for the low amplitude case prior to the industrialization.'

Looking forward to your feedbacks and improvements. We can forward to Oyvind when finalized.

With best regards,

Fortunat

Thanks Tim,

am working my way through the comments

Have also re-read Mike Evans 2002 paper.

I am frustrated with the associate editors comments. He seems to be overtly defending

Mike's reconstruction which are quite different in nature - i.e. he reconstructed 2 spatial

fields - the 1st being ENSO related and the 2nd being probably related to the PDO although

it is not clear from the text.

The coral data-sets are also quite different, with only ~ 4 series being common to both

studies. In fact, many of the coral series used by Mike did not pass my screening process.

Lastly, the only statistic use by Mike for validation is the correlation coefficient. I

like to think I have been a little more robust at least in this regard.

I need to diplomatically word all this. I never wanted to criticise Mike's work in anyway

way. It was for that reason that I made little mention to it initially.

anyway, I hope to get a more cleaner version done by early next week.

will keep you all posted

Rob.

PS. do you have the FORTRAN code for Ed Cook's SSA software?

Subject: Re: Fw: 2005JC003188R Decision Letter

Hi Rob et al.,
seems like there are many points to address - some reasonable, some rather picky.

Some easy things to do... change "all time scales" to "annual to centennial time scales", minor inconsistencies pointed out.

Near the end the comments get a bit picky/stupid. e.g. "according

to

CE reconstruction is less skillful than climatology". Doesn't RE assume "climatology" (= calibration period mean) while CE compares the skill against the assumption that the mean over the verification period is known (which of course it isn't known for a general period outside the instrumental period)? And I really don't think your average reader will be confused into thinking that you calibrated using observations before 1840! Though wording could be changed to "the explained variance of the reconstruction using records

available

before 1840 is quite low" or something similar that fits the flow of the sentence. Also, earlier on, isn't it obvious from the editor's own description of the method that you can indeed estimate verification errors for all "networks", including those available

during

the instrumental period, and thus it is obvious why verification statistics can cover this entire period in Figure 2C,D. The editor just needs to think about things a bit more!
The description of the calibration method can be written in the way that is requested, I'm sure. The difficulty is actually in countering the criticisms that (1) the reconstruction error obtained by regression may no longer be appropriate after the "inflation" step, (2) the use of calibration period residuals rather than verification period residuals to provide the error bars (though here the editor contradicts this suggestion by pointing out that the verification errors apply to no period other than the verification period, but if you assume the same for the calibration errors then where can you get the errors from?).

Hope these quick comments help,

Cheers

Tim

Hi Keith,

will try to look at your text asap. Concerning the issue of the drift in the Von Storch run: they now have at least one paper plus one submitted comment where they redid their model run without the drift, they call this ECHO-G II, the version with drift is now ECHO-G I. I think this argues for leaving the ECHO-G I curve out of the graphs, and just having one sentence in the text stating this is not shown as it was found to drift, and has been superseded. It is an outlier that messes up the graph, and if it is known and even acknowledged by its authors that it is a model artifact, why show it in IPCC?

OK:

Here is the mss. Yes, fingers crossed. Note, this is not for general dissemination until actually "in press".

The article is quite long, due to all the MM issues we address and the extensive discussions concerning use of validation measures we get into.

As a first pass, the Abstract, Discussion, and Summary would be good places to start.

Peace, Gene

Hi Gene - might be better to send the ms now - at least to Keith, since final text is being worked out now. Fingers crossed, thanks, peck

Thanks for this Eugene. It has been very difficult in drafting the 2000-year section text for us to get the balance between too much concentration on the controversy as you call it and the need to describe subsequent work. Sounds like your paper is an important one to signpost in the text.

best wishes

Keith

Valerie and Henry

these are really great and useful comments - I am going to try to get these incorporated , in the time allowed , though today again I am busy with exam question scrutiny board meeting and teaching. Thanks a lot for your help

Keith

At 10:02 23/02/2006, you wrote:

Dear Keith,

A few rapid comments on the section 6.6 revised text. I have enjoyed reading it, more concise, less defensive and key conclusions appear more solid. Sometimes the text is written in the past tense, sometimes in the present tense : it could be homogenised.

Please remove the sentence page 6-15 "The paleohydrologic record of North America is the most complete and diverse of any of the world in part due to the proximity to many well equipped labs but also due to the concern of the frequent change in drought, flood...".

This has nothing to do in a scientific assesment (equipment versus motivation). The same motivation should hold true for all tropical areas!

It would be worth to discuss in one paragraph somewhere (possibly together with the text page 6-6 about the proxies) the methods of tree ring standardisation which seem to have changed over time and lead to larger low frequency signals in the tree ring width based reconstructions.

Comments on the structure :

6.6.1 I think that the italic question for the section does not work. I suggest to add sub questions such as :

What do early instrumental records tell us? (p6-2, lines 7 to 39)

What new reconstruction efforts have been conducted since TAR for NH temperatures (6-2 lines 41 to 6-6 25)

What are the main sources of uncertainties in large scale climate reconstructions (6-6 lines 27 to 49) - should refer to the section introduction / description of proxies

What do NH temperature reconstructions tell us (6-6 lines 51 to 6-8 line 5)

Regarding climate forcings and simulations (6.6.3 and 6.6.4) there must be a cross verification with chapter 9, have you looked at their revised text? The title 6.6.3 includes too much reference to modelling. They have been also statistical efforts to relate forcings and respondes (not only physical models) which have to be mentioned. Then modelling should be in 6.6.4 only. Another way could be to combine both in one section : 6.6.3 would be model-data comparisons with 1) forcings and 2) simulations versus reconstructions. Section 6.6.5 is too long compared to the # of studies conducted here.

Minor comments :

6-3 2 line 20 add "North European records"

line 27 and onwards I think that Boehm reconstruction should be cited around the Alps back to 1780 (it really deserves to be cited).

line 33 Chuine et al puts the French heat wave in a 700 perspective with grape harvest dates, which could be mentioned.

line 36 shorten to "detailed changes in various climate forcings"

line 44 : what are the documentary sources incorporated by Mann? I understand essentially early instrumental records.

6-3 line 49 : this paragraph is a bit vague. Maybe mention more clearly areas where no data are available. Goosse et al GRL 2004 used a synthesis of Antarctica data + simulations to discuss the pb of phase with Antarctica and could be mentioned. I suggest to replace "assimilated" which has a special meaning for meteorologists by "combined"

6-4 line 9 change "are" to "is"

line 16 : how many such long records are available (= what are "very few"?)

6-3 line 39 : is it the rapidity of the 20th c warming or the level of late 20th c temperatures that have to be discussed?

6-5 line 8 use reconstruction, not "series". I understand that one series is one proxy record and a mixture of records with various statistical methods is a reconstruction.

Line 31 : add "many of the individual annually resolved proxy series".

6-6 line 30 change "over a fixed calendar based time window such as J-A or J-D" to "over a specific season"

6-8 line 29 : I propose to change the text about tropical ice cores.

There are few strongly temperature-sensitive proxies from tropical latitudes. Water stable isotope records from high latitude tropical glaciers were first used as temperature proxies but recent calibration and modelling studies have confirmed that tropical precipitation isotopic composition is mostly sensitive to precipitation changes ("amount effect") at seasonal to decadal time scales both in south America and south Tibet.

References :

Hoffmann G, *Ramirez E*, Taupin JD, et al.

Coherent isotope history of Andean ice cores over the last century

<[1]<http://wos.isiknowledge.com/?SID=W1hPnja@D7cM8186jFa&Func=Abstract&doc=17/3>> GEOPHYSICAL RESEARCH LETTERS 30 (4): Art. No. 1179 FEB 25 2003

Vuille M, Werner M, Bradley RS, et al.

Stable isotopes in precipitation in the Asian monsoon region

<[2]<http://wos.isiknowledge.com/?SID=W1hPnja@D7cM8186jFa&Func=Abstract&doc=19/1>> JOURNAL OF GEOPHYSICAL RESEARCH-ATMOSPHERES 110 (D23): Art. No. D23108 DEC 8 2005

By the way, in the same paragraph, you cite tropical glacier retreat as caused by temperature changes. I suggest to refer to chapter 3 on this topic because many studies have also shown that precipitation / relative humidity / albedo effects can be very important for tropical glacier mass balance (see for instance Vincent et al, Comptes rendus Geosciences 2005).

Page 6-8, ground surface temperatures : are there tropical records available that could be explicitly discussed?

The problem of calibration mentioned line 29 (lack of the last decades of the 20th

century) also holds true for many of the long tree ring records... should it be explicitly highlighted here?

6-9 : line 9-10, what is a "much longer warm period", I do not understand. I think that this could be shortened. I still suffer that Antarctica is not mentioned at all. In Goosse et al 2004 I made a stack of 6 records from East Antarctica. There is also one good borehole record from Law Dome (Dahl Jensen Annals of Glacio 1998) showing the same features.

6-10 line 28 : I do not think that it is appropriate to discuss the Solanki paper here.

6-10 and 11 : why mix volcanic and anthropogenic surface aerosols rather than 2 sections? Why not discuss changes in surface occupation (land use) in the forcings for the last millenium at least in one sentence?

6-12, lines 38 and onwards : it seems that this is attribution and detection and should be a summary of chapter 9 or just a cross reference to chapter 9.

Section 6.6.5 (6-12 and 13) is too long compared to the studies cited. Maybe Fortunat could help to make this section more punchy. Should the PhD thesis of MacFarling Meure be cited in this assessment?

Remove "the best known aspects of the records"

Refer to chapter XX for biogeochemical cycles

The last paragraph is probably redondant with respect to the carbon cycle climate feedback discussed in that chapter.

Page 6-14 line 43 : redundancy in this paragraph. Does the coldest European winter have to be discussed in such detail? I would skip this (remove line mid 42 to beg of 45 and keep the last sentence of the paragraph which basically says the same thing.

The section on Asian monsoon variability is not focused on the last 2000 years but on millenial variability => mix with 6.4? Why not cite the Tibet ice core records here (ex Dasuopu 18O which should be a local precip record). There are also high res speleothem records with high resolution. Ramesh should help on this paragraph.

I hope that you find this useful, congratulations for the large improvements of this section and taking into account a record number of comments...

Valérie.

Hello all:

Here is a slightly revised update of the Wahl-Ammann final submission to Climatic Change. It is entirely unaltered in substance, design, methods, results, and conclusions.

The alterations are concentrated in Appendix 1 (the entire rest of the text is unaffected except for three words on p. 17)--focused on eliminating a small gap in logic in our description of the performance of the CE statistic (and to streamline the statements about the sign test and the product means test).

Stephen Schneider has these corrections and is still reviewing the manuscript.

Please replace the version sent earlier this week with this one.

Peace, Gene

Hi Tim,

yes, we processed our own RCS chronology using Jan's Jaemtland data.

I also agree that using Jaemtland or not would make little difference to the results.

Rosanne is presenting at this NAS meeting on Thursday which McIntyre is obviously going to use as a forum to muddy the waters even further. He has given us a hard time about the use of Gaspe and the Polar Urals chronologies and their influence on the 'hockey stick' trend over the past 2 centuries. However, removing these series makes little difference to our results in the past few centuries.

am just going through your e-mails w.r.t. the coral paper - it is a huge help

thanks

Rob

Thanks for the very clear answers Rob.

We didn't use Jaemtland and you did, that is why McIntyre suggested that we disagreed. But in fact our reason for excluding it was not that it didn't correlate with temperature positively, but that we didn't even calculate a correlation because the RCS chronology series we received stopped in 1827 rather than 1978.

It is true that the full set of core data from Jan Esper span the range 1107-1978, but the RCS chronology we received spanned the range 1316-1827 only - and this matches the replication diagram in Esper et al.

([5]http://www.sciencemag.org/content/vol295/issue5563/images/data/2250/DC1/1066208S2_mend.gif)

which stops then for Jaemtland.

Presumably you obtained the set of core data and did your own RCS processing etc., rather than using the Esper et al. RCS chronologies?

Anyway, I think that clears up our supposed "differences" over Jaemtland, though do let me know if you have any more points to add. Our results would have been very little affected by including Jaemtland anyway!

Cheers

Tim

Hi Keith and Øyvind - I agree, this is great, and your priorities are on target. I'll prepare to help on those non-temp subsections after you take a look at the (especially the North Atlantic/NAO one - which is closer to your strength than mine, I suspect).

As for captions, they're in the Figs/Captions Worddoc that Øyvind sent on the 24th.

Thanks to Øyvind for doing the references job as suggested by Keith.

Best, peck

<x-flowed>

Hi Tim, Keith and Stefan - We certainly can't get into the details of the debate, both for space reasons, and because K & T have gotten us away from the more "defensive" impression our FOD gave reviewers and others. Although I share Stefan's concern that we almost have to hammer the misinformation to death, I think we'll be ok dealing with it succinctly, and focusing on the bigger picture - Mann et al., and all the controversy is history - we know much more now, and it makes for stronger statements. Keith and Tim have done a nice job balancing all this, and we have to hope that all the Mann et al controversy will start sounding as dated as it is. I know I make that point pretty clearly when I talk to the media.

BUT, I leave it to Keith and Tim to tweak the discussion to reflect Stefan's concern as appropriate.

thanks, Peck

>Hi Stefan,

>

>our (Keith and mine) understanding of this issue is that Burger et al. (2006, Tellus, already published and therefore citable) already point out the von Storch et al. (2004) mistake in implementing the Mann et al. (1998) method. But we haven't stated this (or cited the Science in press comment) because Burger et al. also demonstrate that when they implement the method without the detrending step (i.e., following the Mann et al. approach more accurately than von Storch et al. did) then the bias is still there, though of smaller magnitude than von Storch et al. (2004) suggested. Given that we already say that the extent of any bias is uncertain, it does not seem necessary to go into the details any further by discussing the implementation by von Storch et al. of the Mann et al. method.

>

>Finally, I think (though here it is less clear from their paper and I am relying on my recollection of talking to Gerd Burger) that Burger et al. also show that the amount of noise von Storch et al. added to create the pseudo-proxies yields a pseudo-reconstruction that has much better verification skill than obtained by Mann et al. (1998) for their real reconstruction. If they increase the noise added (deteriorating the "skill" of the pseudo-proxies) until they get similar verification statistics as Mann et al. report, then the size of the bias gets bigger. In fact, the bias they obtain with the higher noise but "correct" no-detrending method is actually very similar to the bias von Storch et al. reported with lower noise but incorrect detrending method! So where does that leave us? I don't think there's room to put all this in. Of course the magnitude of

>the bias cannot be determined from any pseudo-proxy simulation

Subject: RE: Wahl Ritson Ammann Science article on vonStorch 04
Date: Tue, 28 Feb 2006 13:32:19 -0500
Cc: "Keith Briffa" <k.briffa@uea.ac.uk>, "Eystein Jansen" <eystein.jansen@geo.uib.no>, "Caspar Ammann" <ammann@ucar.edu>

Hello Jonathan, Keith, and Eystein:

I don't yet have any word from Steve Schneider concerning the Wahl-Ammann article on the MBH/MM issues...

...HOWEVER, here is something that slipped under my radar screen, about which I should have made you aware previously. I've attached the ACCEPTED version of the Wahl-Ritson-Ammann comment article on the vonStorch et al. 2004 Science paper. This the article that criticizes MBH for very large low-frequency amplitude losses. The final acceptance from Science just came today, and is copied below.

In this comment article (specifically requested to be expanded to 1000 words by the Science editors), we note that the calibration and verification performance of the MBH method as implemented in VS04 show really poor LF fidelity--which cannot happen if the MBH method is implemented according to its original form. We note this, which is explained by a significant omission on the part of VS04 in implementing the MBH methodology (a detrending step that was only disclosed later last year in a conference proceedings paper). We also comment on physical and statistical reasons why detrending is not appropriate in this context. We conclude that the large amplitude losses VS04 claims are simply not correct.

I am imagining that this contextualization of the VS04 critique would also be relevant for your chapter, and it can now be considered "in press" as the from our Science correspondent notes below. I would think this acceptance makes it "citable". If not, I understand.

NOTE THAT THIS ARTICLE IS SUBJECT TO THE USUAL SCIENCE EMBARGO RULES. I DO NOT BELIEVE THAT THIS MEANS CITATION IS EMBARGOED. (Cf. 4th paragraph in copied message below that supports citation.)

Peace, Gene

Dr. Eugene R. Wahl
Asst. Professor of Environmental Studies
Alfred University

***** copied message below *****

Dear Dr. Wahl,

Below is the formal acceptance of your manuscript. The paper is technically not "in press" yet, though I assume that either "accepted" or "in press" would be acceptable.

Dear Dr. Wahl,

We are pleased to accept your revised Technical Comment on the paper by von Storch et al. for publication.

The text of your comment will be edited to conform to *Science* style guidelines. Before publication you will receive galley proofs for author corrections. Please return the marked and corrected proofs, by fax or overnight express, within 48 hours of receipt.

For authors with NIH grants intending to deposit the accepted version of their paper on PubMed Central, the following text must be displayed as a footnote with an asterisk to the manuscript title:

"This manuscript has been accepted for publication in Science. This version has not undergone final editing. Please refer to the complete version of record at <http://www.sciencemag.org/>. This manuscript may not be reproduced or used in any manner that does not fall within the fair use provisions of the Copyright Act without the prior, written permission of AAAS."

As noted in our License for Publication, the manuscript cannot be posted sooner than 6 months after final publication of the paper in Science.

As you know, the full text of technical comments and responses appears on our website, Science Online, with abstracts published in the Letters section of the print *Science*.

Thanks for your patience during this long process, and thanks for publishing in *Science*.

Sincerely,

Tara S. Marathe
Associate Online Editor, Science

Hi Stefan,

our (Keith and mine) understanding of this issue is that Burger et al. (2006, Tellus, already published and therefore citable) already point out the von Storch et al. (2004) mistake in implementing the Mann et al. (1998) method. But we haven't stated this (or cited the Science in press comment) because Burger et al. also demonstrate that when they implement the method without the detrending step (i.e., following the Mann et al. approach more accurately than von Storch et al. did) then the bias is still there, though of smaller magnitude than von Storch et al. (2004) suggested. Given that we already say that the extent of any bias is uncertain, it does not seem necessary to go into the details any further by discussing the implementation by von Storch et al. of the Mann et al. method.

Finally, I think (though here it is less clear from their paper and I am relying on my recollection of talking to Gerd Burger) that Burger et al. also show that the amount of noise von Storch et al. added to create the pseudo-proxies yields a pseudo-reconstruction that has much better verification skill than obtained by Mann et al. (1998) for their real reconstruction. If they increase the noise added (deteriorating the "skill" of the pseudo-proxies) until they get similar verification statistics as Mann et al. report, then the size of the bias gets bigger. In fact, the bias they obtain with the higher noise but "correct" no-detrending method is actually very similar to the bias von Storch et al. reported with lower noise but incorrect detrending method! So where does that leave us? I don't think there's room to put all this in. Of course the magnitude of the bias cannot be determined from any pseudo-proxy simulation anyway, and will be different for different models.

We'd be interested to know if your (or others on the cc list) interpretation of Burger et al. (2006) is significantly different to this.

Cheers

Tim

Hi Tim,

my simplistic interpretation as an outside observer of this field is:

VS04 published a high-profile analysis in Science concluding that the performance of the MBH method is disastrously bad. Subsequently, VS in the media called the MBH result "nonsense", accused Nature of putting their sales interests above peer review when publishing MBH, and called the IPCC "stupid" and "irresponsible" for highlighting the results of MBH. This had *major* political impact - I know this e.g. from EU negotiators who were confronted with this stuff by their US colleagues.

Then it turns out that they implemented the method incorrectly. If it is done as MBH did, variance is still somewhat underestimated in the same pseudoproxy test, but only a little, within the error bars given by MBH and shown by IPCC. Certainly nothing dramatic - one could conclude that the method works reasonably well but needs improvement. This would have been a technical discussion with not much political impact.

What VS and their colleagues are doing now, rather than publishing a correction of their mistake, is saying: "well, but if we add a lot more noise, or use red noise, then the MBH method is still quite bad..."

The question here is: should our IPCC chapter say something to correct the wrong impression which had the political impact, namely that the MBH method is disastrously bad? This is not the same as the legitimate discussion about the real errors in proxy reconstructions, which accepts that these reconstructions have some errors but are still quite useful, rather than being "nonsense".

Cheers, Stefan

Hello all:

Good news this day. The Wahl-Ammann paper also has been given fully accepted status today by Stephen Schneider. I copy his affirmation of this below, and after that his remark from earlier this month regarding this status being equivalent to "in press". I hope this meets the deadline of before March 1 for citation.

Peace, Gene

Hello Jonathan, Keith, and Eystein:

I want to make a reminder about the embargo for release of the WRA Science comment article. Please do not disseminate this article to anyone else, or discuss it publically until it is actually published, which I know Science wants to do soon. I still believe citation is appropriate, and I have asked for clarification on this from the editors. I will let you know what/if I hear from them.

FYI, this issue is also related to the NAS committee looking into last millenium surface temperature reconstructions this week, as I think you are aware. Today, the NAS staff person working with this committee said he talked to Jesse Smith of Science about this article, who mentioned he could say nothing, but referred the staff person to me. I was not really sure what this meant, and so I did not say anything specific on this myself, to ensure that I would not be in conflict with the embargo. That is where it stands in that arena for now.

As you saw in the message from Steve Schneider that I copied to you, however, there is no embargo of any kind on use of the Climatic Change article.

Subject: [Wgl-ar4-las] Inappropriate Press Reports
Date: Wed, 1 Mar 2006 10:17:35 -0700
Cc: reate christ <RChrist@wmo.int>, bubu jallow2 <dwr@gamtel.gm>, bubu jallow1 <bubujallow@hotmail.com>, Jian Liu <Jianliu@wmo.int>, jouzel <jouzel@dsm-mail.saclay.cea.fr>, IPCC Chair <chairipcc@teri.res.in>

Dear Colleagues,

It has come to our attention that certain preliminary results of the WGI draft report may

have been provided inappropriately to the press, particularly the Guardian and the BBC.

Due to the nature of some of the specific material now appearing in the press (i.e.,

specific numbers discussed in our last LA meeting but not yet presented to others; see

<http://www.guardian.co.uk/frontpage/story/0,,1719608,00.html>),

and the nature in which it is being cited (i.e., a 'source' as indicated in

<http://news.bbc.co.uk/1/hi/sci/tech/4761804.stm>), there may be a connection to someone

inside our team, and this is both extremely disappointing and concerning to us.

As you will all be well aware, all of our findings are currently under development and

cannot be quoted or cited until the report is officially finalized at the end of January,

2007. Please do not give anyone the impression that you can currently represent

information on behalf of the IPCC, or provide information about the draft material in the

report. To do so would be not only a great discourtesy to your colleagues but may allow

others to question the credibility of the IPCC process.

We have previously circulated the attached LAGuide.pdf and are recirculating that here. We

would like to emphasize here that this applies to everyone involved in the report,

including review editors as well as authors, co-chairs, and bureau members. Please let us

know immediately at ipcc-wgl@al.noaa.gov if you find any aspect of this document

unacceptable to you.

We cannot overstate the importance of our all paying scrupulous attention to ensuring that

IPCC draft results are not revealed in any way that could lead to their appearing in a

press venue prior to formal approval. Please redouble your efforts to avoid being

misquoted, or misidentified as representing the IPCC's draft fourth assessment report.

Best regards,

Susan Solomon, Martin Manning and Qin Dahe

<t.osborn@uea.ac.uk>, Keith Briffa <k.briffa@uea.ac.uk>,
cddhr@giss.nasa.gov, Eystein Jansen <eystein.jansen@geo.uib.no>

Hi all,
let me add to Fortunat that I feel Keith and Tim have done a tremendous job in very thorny terrain. And I agree with Peck - science has moved way past the "hockey stick" debate, and it is great how our chapter shows that. Nevertheless, we should remember that the Von Storch et al. (2004) critique was a fundamental methodological critique that applies to *all* (or at least most) proxy reconstructions - it is not just a Storch vs. Mann quarrel (although it is that as well, of course). Hence it is worth mentioning their error, else this could still call the entirety of our conclusions from that section into question. Currently, our draft just says:

At present, the extent of any such bias in specific reconstructions is uncertain

This is true, but leaves in my view slightly too much room for interpretation - like, it would still encompass the interpretation that the bias of all reconstructions is disastrous, so they are all "nonsense" in Von Storch's words. What about saying something along the lines: "At present, the extent of any such bias in specific reconstructions is uncertain, although probably not as large as suggested by Von Storch et al. (2004), whose work was affected by a calibration error (Wahl, Ritson and Amman, 2006)."
Regards, Stefan
p.s. Tim: Are you convinced the more recent papers by the VS group use the correct calibration? In those curves that are intended to show the pseudoproxies perform poorly even when calibrated correctly, as long as you add a lot more noise, I wonder why the pseudoproxies perform poorly even within the calibration interval, where they now should be calibrated to properly reproduce the 20th C warming trend, and they don't?

>(Wahl, Ritson and Amman, 2006)."

This sounds good and Keith is currently working your suggested
wording into the paragraph in question.

>p.s. Tim: Are you convinced the more recent papers by the VS group

I am not certain, of course. And yes, there is a link between the
degree to which the trend over the calibration period is captured and
the amplitude of long-term fluctuations in the reconstruction. That
many of Burger's multitude of methods do not obtain the full warming
trend, while Mann et al. do, is certainly a concern here. But it is
also true (and I have myself analysed this one year before von Storch
et al. was published - if only I'd realised the implications I could
have had another Science paper! :-)) that correct implementation of a
regression method, keeping the trend in, can still lead to a massive
underestimation of that trend. So there's still more work to be done
on this topic!

Cheers

Tim

Subject: Text here for 6.6 BUT not references -help
Date: Wed Mar 1 21:50:02 2006
Cc: jto@u.arizona.edu,Eystein Jansen <eystein.jansen@geo.uib.no>,t.m.melvin@uea.ac.uk

Peck

here is a version you can look at. The text in blue , I suggest deleting.

please also see my message to Oyvind below

Oyvind

here is a word file that is very near to the final version for this stage, of the 6.6 section.

NOTE that we (really Tom Melvin here) have had a nightmare with trying to get references in endnote and keeping the text as I wrote it . We need to work on finding and sorting a few references - but in working today , Tom found endnote reordering the references being called out in the text - actually moving them into incorrect places! To meet todays deadline I am sending this word file version of my text , which except for possible minor typos , is the version that I consider done (with the exception of changes Peck may wish to make to the Regional section).

Tomorrow , could you please liaise with Tom here (see his email cc'd) to discuss how to get the same text associated with the correct references in the way you want. Tom, as far as I understand is mostly there - but whether his version of this text corresponds with what it should say now - is beyond my comprehension. I have had enough of this system and I think we should have simply used word. I am sure there will be minor formatting problems and inconsistencies in the way cross referencing is done in what I am sending . I am also sure that knowing which reference was meant and which is now cited will take some sorting . Please let Tom know how you wish to proceed with this as soon as you know and he may be able to comply. Thanks - now I am going home

Keith

Dear Dr. Osborn,

Thank you for your clear and careful response to the requests made by Dr. McIntyre, which we forwarded to you: it was quite satisfactory, we believe, and will greatly help Brooks (Hanson) in crafting his reply to Dr. McIntyre. I hope that this will be the end of this episode, but if it is not, we will be in touch again.

Best regards,

Jesse Smith

>>> Tim Osborn <t.osborn@uea.ac.uk> 3/3/2006 11:22:17 AM >>>

Dear Jesse Smith and Brooks Hanson,

thank you for your patience while waiting for our reply. Before responding to the specific data requests, we would like to say that it is our view that we should provide sufficient data to enable all the main elements of our analysis to be checked, but that we are not obliged to provide the data that would enable the research reported in other papers to be checked, even if we cite those other papers or

use results reported in those other papers. You will see how this view has determined our response to some of the requests.

Now to the requests themselves, numbered according to the numbering system of Steve McIntyre's email.

(1) As you know, we provided (in advance of publication) the 14 smoothed and normalised proxy records to WDC-Paleo that enable the main parts of our analysis to be replicated. The only part of our analysis for which the unsmoothed data are required is to calculate the correlations against temperature that we reported for some of the series (not those that had already been reported by Mann and Jones, as indicated in our Table S1). These unsmoothed data for all 14 series are now also archived at WDC-Paleo, which will enable those correlations that we reported in Table S1 to be checked. These unsmoothed data were archived on Thursday 23rd February, in response to a request by a different colleague. This should cover this request in full.

(2) Our Table S1 provides the full citation to the source of our data, funnily enough given in the column labelled "Data source". Some of these may or may not have publicly archived their data, but our WDC-Paleo entry now contains the series that we were originally provided with (i.e., the unsmoothed data that we refer to in item (1) above). The "Orig source" column in our table was our effort to ensure that original work on collecting/processing these data is acknowledged, because it is important for us to acknowledge that work even when we obtained the data from a secondary study. We did not intend to imply that the data that we had used would match the data in these original sources, because various different versions might exist (due, e.g., to different methods of processing the data, or due to updated measurements, etc.). That is why we made the source of our data clear.

(a-c) We have not yet had time to double check the ITRDB citations that we provided for these three records, but we will do so as soon as we have time. Our data source was in fact Esper et al. (2002) and this is correct, so the concern over the accuracy of these ITRDB citations does not limit the ability for others to check our work.

(d-f) The original studies that we cite are definitely correct for these two records. We have provided sufficient data for our analysis of these records to be checked. We have not provided extra data to enable other people's studies to be checked, nor do we feel obliged to do so.

(g) These series from Esper et al. (2002) were considered by us and then rejected. As we understand it, Esper et al. have made available their site RCS records and therefore these four records could be obtained from Esper et al. If this is not the case, we could provide these four rejected series.

(3) D'Arrigo et al. (2006) do **not** report directly opposite findings in respect to the correlations we obtain for Jaemtland and

Boreal/Upperwright. Neither paper reports any correlations involving these series versus temperature. Both papers list more than one reason why series might be rejected. For example, our reasons were "We removed series from (S1) that did not correlate positively with their local annual or summer temperatures (Table S1), or which did not extend into the period with instrumental temperature to allow a correlation to be calculated." The latter is our reason for excluding Jaemtland, not the former: the Jaemtland series that we obtained from Esper et al. (2002) has no data after 1827 and so no correlation was calculated. The Jaemtland series used by D'Arrigo et al. continues through to 1978 due to the inclusion of additional data. Similarly, D'Arrigo et al. list a number of reasons for excluding series, but they do not state which one(s) were used to exclude Boreal and Upperwright, though in fact none disagreed with our criteria anyway!

We have not separately stored the temperature time series used to obtain the correlations reported in our Table S1 and to do so requires some changes to our program, which we have not done because there does not appear to be a need to do so (given our explanation above of the situation regarding our paper versus D'Arrigo et al., 2006).

Because Steve McIntyre has explicitly stated that he is unable to verify our results for the Boreal/Upperwright case, we have extracted the temperatures we used for that case only and attach them here as a text file. We hope that he can use them to reassure himself about the correlations that we obtained.

(4)

(a) We explicitly state that we did not use the Esper et al. (2002) Jasper series, so there is no expectation that they should be identical. Esper et al. (2002) have, we believe, made their version available and we have made available the series that we used via WDC-Paleo.

(b) Similarly, we explicitly state that we did not use the Esper et al. (2002) Tornetrask series and data are available as for (a).

(c) We are not obliged to confirm anything that Esper et al. (2002) did.

(5) This request is not relevant to our paper, as discussed at the start of this email.

(6) Same as (5).

We hope that we have dealt with these requests to a more than satisfactory extent, but please let us know if you feel that we should do more.

Best regards

Tim Osborn and Keith Briffa

Hi folks - seems the listserv is down again. Please take a look at the attached draft chap

6 glossary and send comments to me and David Rind today if you have any (Jim Z - hope you can look at the way we've butchered the preQ defns). Eystein and I would like to send to TSU tonight if we can.

Thanks, Peck

Hi David (and those who have contributed) - thanks!
I've attached a revised version, with my edited sections highlighted in yellow. I've tried to update some definitions to be more accurate (agree w/ Stefan, by the way, regarding D/O events), and also to standardize mention of time intervals. Also, I don't think we want to cite the sources you have cited, since these were only the sources used to get going. I think many of the definitions are updated significantly by our team. If you get any other feedback today, great. Please forward me and Eystein your final version at the end of the day, and we'll send to the TSU (and Fons). If you get no additional input, just let us know and we can send in the attached version w/ the yellow shading removed.

Thanks again, Peck

<x-flowed>

Hi gang - Richard is raising important issues, and Keith is going to respond in some detail on Friday when he gets back. I am cc'ing this to a broader group of IPCC Chap 6 folks so that we make sure we (chap 6) deal with the issues correctly. I'm hoping that Keith will cc to us all, and we'll go from there.

For those just in on the issue raised by Richard. There is a paper written by Rosanne D'Arrigo that apparently casts serious doubt on the ability of tree ring data to reconstruct the full range of past temperature change - particularly temperatures above mid-20th century levels. Chap 6 obviously has to deal with this more in the next draft, so Eystein and I would like to get on top of it starting this week.

Keith or Richard - do you have a copy of this paper? Is it accepted?

Thanks, Peck

<x-flowed>

Hi gang - Richard is raising important issues, and Keith is going to respond in some detail on Friday when he gets back. I am cc'ing this to a broader group of IPCC Chap 6 folks so that we make sure we (chap 6) deal with the issues correctly. I'm hoping that Keith will cc to us all, and we'll go from there.

For those just in on the issue raised by Richard. There is a paper written by Rosanne D'Arrigo that apparently casts serious doubt on the ability of tree ring data to reconstruct the full range of past temperature change - particularly temperatures above mid-20th century levels. Chap 6 obviously has to deal with this more in the next draft, so Eystein and I would like to get on top of it starting this week.

Keith or Richard - do you have a copy of this paper? Is it accepted?

Thanks, Peck

Dear All,

A lot of good points raised by the horizontal Eystein. Keith is hoping to do something on the recent tree growth issue.

What this sad crowd (nice words - I'll use the phrase again) don't realise is that the satellite data now agree with the surface. This is said in Ch 3 and will come home more forcefully once the CCSP report on vertical temperature trends comes out. This should be April or May according to Tom Karl who is overseeing it all. I say should as it apparently has to be approved by the White House! Peck will know why this is and the expertise of the people doing the approval!

I can say for certain (100% - not any probable word that IPCC would use) is that the surface temperature data are correct.

McIntyre is determined and the blog does influence people, unfortunately the media. As you say as issues are partially closed, they will move on to others.

Cheers
Phil

Subject: NRC and IPCC millennial temperatures

Date: Sat, 11 Mar 2006 15:27:19 -0500 (EST)

Cc: mmanning@al.noaa.gov, ssolomon@al.noaa.gov

Friends in the IPCC WG1 AR4--

My impression is that, for good reasons, the US NRC panel looking at the record of temperatures over the last millennium or two is not going to strongly endorse the ability of proxies to detect warming above the level of a millennium ago, and that a careful re-examination of the Chapter 6 wording and its representation in the TS and SPM would be wise. Some of you have seen some of the discussion that follows, in some of the rapid-fire emails over the last day or two, but I'd like to clarify a little.

Please note that I am NOT on the NRC committee, do not speak for them, and have no "inside" knowledge of what they are doing. I was asked to testify to them, and I heard remarks from some other speakers and questions from the committee in public forum. I did NOT represent the IPCC to the committee, either; I stated that although I was proud to be participating with the IPCC, I absolutely was not speaking for, representing, or presaging anything in the IPCC. (I was, however, favorably quite impressed with the NRC committee and their efforts.) Someone else may have a different impression of what went on; this is mine.

Among the presentations, involving borehole temperatures, corals, glaciers and ice cores, and historical records, that which to me seemed to interest the committee most was from Rosanne d'Arrigo, who reported (among many other things) on a just-published study in which northern tree-ring sites were revisited and updated, and in which many of those sites failed to track the recent warming documented instrumentally. She did not make a big deal out of this, but several of the questions afterward from the committee focused on this "divergence" problem. (And to note, Rosanne did not discover the divergence problem, which has been around and discussed for a while; her testimony, including the recent large effort to update some tree-ring records, stirred interest from some committee members.)

I would also note that one of the committee members was asking each presenter whether the presenter believed that temperatures could be reconstructed for

1000 years ago within 0.5 C, and that the presenters were answering with some qualified version of "no".

My guess is that the NRC committee will put these things together, find some papers on ozone damage and CO2 fertilization, consider Rosanne's statement that the preferred temperature-sensitive trees are rare and in restricted places (and thus that a prolonged warming could easily move those trees out of the sensitive band), and conclude that tree-ring reconstructions include larger errors than are returned by any of the formal statistics from calibration or aggregation of records, and thus that there is less confidence than previously believed in the relative warmth of recent versus Medieval times. I also consider it possible that they will point out the difficulty of using a composite temperature history consisting of proxy and instrumental data if some of the proxy data do not track the more-recent part of the instrumental data.

The IPCC must be the IPCC, not the NRC. But, if the IPCC and NRC look very different, there will be much comment, and we will have to be very sure. More importantly, I believe that real issues are raised here, and that better discussion of this should be included in chapter 6, and probably brought forward at least into the TS. I know I'm not in chapter 6, I know I'm not a tree-ring expert, and I know I'm sticking my nose in where it might not belong or be welcome. But the flurry of emails in the last couple of days has not convinced me that this one can be ignored; indeed, I am more convinced that there exist issues that the IPCC must discuss more thoroughly.

My impression of the status (and my thoughts about what chapter 6 might say) from a whole lot of quick reading, your emails, and the testimony and questions I heard, is along the lines of:

--> The TAR highlighted a temperature history composited from multi-proxy paleoclimatic indicators plus the instrumental record, showing anomalous recent warmth, with the recent warmth emerging well above the 95% confidence interval for the last millennium.

--> The multi-proxy paleoclimatic indicators reflect tree-ring results more than any other source.

--> Tree-ring records are responsive to many factors, and great care and effort go into isolating the temperature signal from other signals.

--> Tree-ring data, in common with essentially all paleoclimatic data, are not collected in a continually updated "operational" fashion analogous to that used for meteorological data, so the data sets end at different times; data used in the multi-proxy reconstructions cited in the TAR ended between the 1990s and the 1940s. This difficulty motivated the need to include instrumental as well as proxy data in the reconstructions.

--> In those data, there was some suggestion of non-temperature influences on the tree-ring reconstructions; in particular, some of the most-recent records did not record the full amplitude of the instrumental warming. This has come to be known as the "divergence" issue.

--> Much research has been conducted since the TAR, and additional evidence of divergence has emerged in some records, causing some aggregated reconstructions from proxy records to show less warming than does the instrumental record.

--> There are many hypotheses for non-temperature influences on tree-ring records, including: (i) recent damage (as by ozone); (ii) recent fertilization (as by CO₂); and (iii) decreasing sensitivity of tree-ring growth to temperature with increasing temperature (once it's warm enough, the trees are primarily responsive to other things). The nature of these and their timing relative to the interval in which tree-ring data were calibrated to instrumental records would control the effects on climate reconstructions. In general: (i) would mean that recent warmth is underestimated but warmth from a millennium ago is not; (ii) would mean that recent warmth is overestimated but warmth from a millennium ago is not; and (iii) would mean that both recent warmth and warmth from a millennium ago are underestimated.

--> Various arguments have been advanced to support (i), (ii), or (iii), with many workers in the field favoring (i). Nonetheless, further characterizing recent non-temperature influences on tree-ring growth remains an open research question, and no broad consensus has emerged on (i), (ii), (iii), or something else.

--> These considerations do not affect the conclusion that recent warmth is anomalous over the last few centuries; the strong correlations of the proxy data with temperature over the instrumental record, and the strong tree-ring signals, are evident.

--> These considerations do not affect the best estimate that recent warmth is greater than that of a millennium ago; the central estimate from proxy data

of latter-twentieth-century warmth is still above that of a millennium ago, with greater spatial coherence recently in the signal.

--> These considerations do somewhat affect the confidence that can be attached to the best estimate of recent warmth versus that of a millennium ago. If the paleoclimatic data could be confidently be interpreted as paleotemperatures, then joining the paleoclimatic and instrumental records would be appropriate, and the recent warmth would clearly be anomalous over the last millennium and beyond. By demonstrating that some tree-ring series chosen for temperature sensitivity are not fully reflecting temperature changes, the divergence issue widens the error bars and so reduces confidence in the comparison between recent and earlier warmth.

Hi Ed and Keith - I hate to say it, but Richard's take on the political aspects of the NRC vs. IPCC reports seem worth some extra effort. Since you were both invited to speak with the NRC committee, I would suggest that you both (together or separately) submit formal comments asap. I don't know when the comment period starts or ends, but I'm guessing you have to work fast. I'm also thinking that you two might want to get out a peer-reviewed paper on the topic really soon too. I worry that the hole will continue to deepen for dendroclimate if you two don't act to clarify what we know/don't know, and when it is safe (and why) to use dendroclimate data to address the issue of long-term variation in temperature.

Please don't construe my suggestions or comments as pro/con dendro, but rather just as someone who wants the truth - whatever it is - to be communicated clearly, and as best we know it. But, I do think that if Richard is suspect, dendro has a real problem. He doesn't have a personal bias in this, and is clearly trying harder than most to understand what's really going on with climate and the proxies.

Effort now might save time later.

Also, are you both going to be at the Swiss mtg in June? We really have to get this all ironed out better before the next (last) draft of the IPCC AR4.

Thanks, Peck

Hi Ed - thanks for trying to fit something in quick for the NRC group. I'm not sure about Richard's full motives, but I think he has his heart in the right place - that the NRC Committee might have gotten the impression he did, and this will be reflected in their report, perhaps in a way that is even less satisfactory to you and Keith. And, this report will likely have enormous political potential. It needs to get things as right as possible from the start. So... time well spent on the part of you and Keith. Thanks much, peck

Hi Peck,

Being in Bangkok, on to PACLIM, on to CONCORD in Mendoza, back to Bangkok, and back to NY on May 1 makes it difficult for me to do much, but I will do what I can to salvage a bad situation. The longish emails I sent out to you all contain much of what I would write. The main point to make, one that Richard seems to be totally oblivious to, is that there is no evidence for loss of sensitivity prior to the 20th century in a large-scale NH sense like that seen in the 20th century. On the other hand, there is evidence that there was not a loss of sensitivity in a large-scale NH sense in my QSR paper (Fig. 6). I acknowledge the weakness in the data prior to about 1200, but even so the regional comparisons only show divergence between north and south in the 20th century, with none indicated during the putative MWP. So why is Richard and the NRC panel apparently stating without evidence that divergence probably is a problem in the past and, therefore, tree rings cannot be trusted to reconstruct past temperatures? It is honestly unscientific when the only evidence that I have seen refutes that premise, and it plays unfairly into McIntyre's hand. I almost admit to being very irritated that Richard should anoint himself as the arbitrator of this debate. He knows nothing substantive about tree rings. In that sense, he is just like Ray Bradley.

Cheers,

Ed

Cc: Eystein Jansen <eystein.jansen@geo.uib.no>, Keith Briffa <k.briffa@uea.ac.uk>

Hi Ed (and Keith) - this looks good. For what it's worth, here are some comments:

1. I agree Keith should send in an independent letter by email too (I'd put both on letterhead or at least include as pdf attachments, so email forwarding wouldn't have the chance of messing it up) .
2. I would say right up front - first line that you'd like your letter (s) to go to all committee members, if possible with a cc to you. Don't leave any wriggle room.
3. cc to G. North and B. Otto-Bliesner - again, so there is no doubt that this gets to everyone
4. no need to mention IPCC. Focus on the science and the NRC review. Don't want to introduce extra politics.

Thanks both for doing this - I agree there is a real need to ensure that the panel has the science from the experts.

Best, peck

Hi everyone,
Here is a draft of what I want to quickly send to
Ian Kraucunas, Ph.D.
Board on Atmospheric Sciences and Climate
National Research Council of The National Academies
500 Fifth Street NW, Keck 705
Washington, DC 20001
Email: ikraucunas@nas.edu
Phone: (202) 334-2546
Fax: (202) 334-3825

He originally invited me to talk before the NRC. I do not have any other information on who to send it too. Please let me know what you think, but don't be too pedantic or critical at this stage. I get the feeling we have very little time to make an impact on the NRC committee and its report. I personally think that I am correct as far as I can take the argument. Let me know if I should send this on to Richard as well.

Ed

Dear Ian,

I have heard via emails and telephone conversations about some rather serious developments that could have an unfairly negative impact on the use of tree rings for reconstructing past climate and the upcoming IPCC assessment, especially that related to surface temperatures. Apparently as part of her talk Rosanne D'Arrigo mentioned the phenomenon of "divergence" between instrumental temperatures and tree growth in the latter few decades of the 20th century. The large-scale nature of this phenomenon was first described in *Nature* by Keith Briffa back in 1998 (Briffa et al., 1998) and to this day its cause is not well understood at all. A number of hypotheses have been mentioned, which range from natural (climatic change) to anthropogenic (i.e. pollution related), but the actual cause is still unknown.

Somewhat alarmingly, it is my impression now the the NRC committee members and other influential participants of the meeting have come to the conclusion that the observed 20th century "divergence" calls into serious question the value of the tree-ring reconstructions of temperatures over the past millennium. The implicit assumption being made is that the "divergence" is being caused by climatic change related to 20th century warming, conditions that could have also prevailed back during the Medieval Warm Period (MWP) some 800-1000 years in the past. If this were the case, then the concerns of the committee would be justified. However, the available evidence does not support such a conclusion. In a paper I published in *Quaternary Science Reviews* in 2004 (Cook et al., 2004), I reviewed the properties and interpretation of the tree-ring data used in the Esper et al. (2002) paper published in *Science*. The reasonably well distributed set of tree-ring data in both boreal and more temperate latitude sites around the Northern Hemisphere allowed me to split up the data into sub-regional ensembles, including 8 sites in the 55-70° north band and 6 sites in the 30-55° south band. The purpose was to show the overall robustness of the multi-centennial temperature signal in the tree-ring data. This plot from the QSR paper is attached below as is the paper itself.

In his 1998 paper, Briffa showed that the divergence was largely restricted to the region covered by the north band described in Cook et al. (2004). Consistent with that finding, the north ensemble mean shown below reveals a serious downturn in growth after about 1950. This is an expression of the "divergence" that has been described first by Briffa and also by D'Arrigo in her NRC talk. In contrast, the south ensemble mean shows the opposite, i.e. a substantial growth increase which is much more consistent with 20th century warming. If one then follows the plots back in time, all of the sub-region ensemble means track each other remarkably well at multi-centennial time scales even when they enter the putative MWP 800-1000 years ago. In fact, at no time prior to the 20th century is there separation between north and south that is remotely comparable to that found after ca. 1950. This result suggests that no large-scale "divergence" of the order found during the 20th century occurred during the MWP even though that period is suggested to have been somewhat warmer than average overall. This result clearly refutes the argument that "divergence" of the kind noted in the 20th century happened in the past. It also suggests a unique anthropogenic cause to the 20th century divergence.

I am not aware of ANY evidence that demonstrates the occurrence of large-scale "divergence" in the past. It is therefore unjustified to call into question the use of tree rings for reconstructing temperatures over the past millennium based on a naive extrapolation of growth "divergence" into the past when it appears to be unique to the 20th century. The NRC committee members must be made aware of this if their report is to have the necessary scientific credibility that is expected of it.

Sincerely,

Edward R. Cook

?

?

Hi everyone,

Here is a draft of what I want to quickly send to

Ian Kraucunas, Ph.D.

Board on Atmospheric Sciences and Climate

National Research Council of The National Academies

500 Fifth Street NW, Keck 705

Washington, DC 20001

Email: [1]ikraucunas@nas.edu

Phone: (202) 334-2546

Fax: (202) 334-3825

He originally invited me to talk before the NRC. I do not have any other information on who to send it too. Please let me know what you think, but don't be too pedantic or critical at this stage. I get the feeling we have very little time to make an impact on

the NRC committee and its report. I personally think that I am correct as far as I can take the argument. Let me know if I should send this on to Richard as well.

Ed

Dear Ian,

I have heard via emails and telephone conversations about some rather serious developments that could have an unfairly negative impact on the use of tree rings for reconstructing past climate and the upcoming IPCC assessment, especially that related to surface temperatures. Apparently as part of her talk Rosanne D'Arrigo mentioned the phenomenon of "divergence" between instrumental temperatures and tree growth in the latter few decades of the 20th century. The large-scale nature of this phenomenon was first described in Nature by Keith Briffa back in 1998 (Briffa et al., 1998) and to this day its cause is not well understood at all. A number of hypotheses have been mentioned, which range from natural (climatic change) to anthropogenic (i.e. pollution related), but the actual cause is still unknown.

Somewhat alarmingly, it is my impression now the the NRC committee members and other influential participants of the meeting have come to the conclusion that the observed 20th century "divergence" calls into serious question the value of the tree-ring reconstructions of temperatures over the past millennium. The implicit assumption being made is that the "divergence" is being caused by climatic change related to 20th century warming, conditions that could have also prevailed back during the Medieval Warm Period (MWP) some 800-1000 years in the past. If this were the case, then the concerns of the committee would be justified. However, the available evidence does not support such a conclusion. In a paper I published in Quaternary Science Reviews in 2004 (Cook et al., 2004), I reviewed the properties and interpretation of the tree-ring data used in the Esper et al. (2002) paper published in Science. The reasonably well distributed set of tree-ring data in both boreal and more temperate latitude sites around the Northern Hemisphere allowed me to split up the data into sub-regional ensembles, including 8 sites in the 55-70° north band and 6 sites in the 30-55° south band. The purpose was to show the overall robustness of the multi-centennial temperature signal in the tree-ring data. This plot from the QSR paper is attached below as is the paper itself.

In his 1998 paper, Briffa showed that the divergence was largely restricted to the region covered by the north band described in Cook et al. (2004). Consistent with that finding, the north ensemble mean shown below reveals a serious downturn in growth after about 1950. This is an expression of the "divergence" that has been described first by Briffa and also by D'Arrigo in her NRC talk. In contrast, the south ensemble mean shows the opposite, i.e. a substantial growth increase which is much more consistent with 20th century warming. If one than follows the plots back in time, all of the sub-region ensemble means track each other remarkably well at multi-centennial time scales even

when they enter the putative MWP 800-1000 years ago. In fact, at no time prior to the 20th century is there separation between north and south that is remotely comparable to that found after ca. 1950. This result suggests that no large-scale "divergence" of the order found during the 20th century occurred during the MWP even though that period is suggested to have been somewhat warmer than average overall. This result clearly refutes the argument that "divergence" of the kind noted in the 20th century happened in the past. It also suggests a unique anthropogenic cause to the 20th century divergence.

I am not aware of ANY evidence that demonstrates the occurrence of large-scale "divergence" in the past. It is therefore unjustified to call into question the use of tree rings for reconstructing temperatures over the past millennium based on a naive extrapolation of growth "divergence" into the past when it appears to be unique to the 20th century. The NRC committee members must be made aware of this if their report is to have the necessary scientific credibility that is expected of it.

Sincerely,

Edward R. Cook

Here's the next one

Dear Oyvind,

sorry for the delay, I've been off work for a couple of days due to unexpected family illness.

here are the EPS format figures. I'll send in separate emails due to their size. I've tried to number them correctly according to the new numbering, though please open them to check they look ok.

One thing to note is that I have separate files for the two panels of the MWP box figure, and also the forcings/models figure is also in two files. They are all labelled appropriately, with the panel part in the filename, so I hope this is no problem!?

You should get these files:

ipccar4_fig6.10.eps
ipccar4_fig6.11.eps
ipccar4_fig6.12.eps
ipccar4_fig6.13abcd.eps & ipccar4_fig6.13e.eps
ipccar4_box6.4_fig1a.eps & ipccar4_box6.4_fig1b.eps

Please let me know if they don't all arrive!

Cheers

Tim

Ian Kraucunas, Ph.D.

Board on Atmospheric Sciences and Climate

National Research Council of The National Academies

500 Fifth Street NW, Keck 705

Washington, DC 20001

Dear Dr. Kraucunas,

I request that this document (also attached as Cook_NRC.pdf) and the attached scientific paper (2001_Cook_QSR.pdf) be forwarded to all NRC committee members who participated in the recent NRC workshop "Surface Temperature Reconstructions for the Past 2,000 Years: Synthesis of Current Understanding and Challenges for the Future", ideally with a cc to me when this is done. I have heard via emails and telephone conversations about a serious concern raised about tree rings by some committee members and invited participants at the NRC workshop. This concern could have an unfairly negative impact on the use of tree rings for reconstructing past climate, especially that related to surface air temperatures, hence my letter to you and the committee. As part of her talk, Dr. Rosanne D'Arrigo mentioned the discovery of "divergence" between instrumental temperatures and tree growth during the last few decades of the 20th century at selected boreal sites in the Northern Hemisphere. The affected trees systematically under-responded to increasing temperatures, i.e. they grew more slowly than they should have based on a well-fitted linear response model applied to the data prior to the onset of "divergence". The large-scale occurrence of this change in responsiveness has also been described by Keith Briffa (Briffa et al., 1998) in Nature. A number of hypotheses have been proposed to explain it, which range from natural (climatic change) to anthropogenic (pollution related), but the actual cause is still unknown. This phenomenon needed to be mentioned by Dr. D'Arrigo, but it appears to have taken on a level of specious importance that is not justified by the evidence.

Perhaps not surprisingly, but also somewhat alarmingly, it is my understanding that some NRC committee members and other influential participants have come to the conclusion that the observed 20th century "divergence" calls into serious question the value of the tree-ring reconstructions of temperatures over the past millennium. The implicit assumption apparently being made is that the "divergence" being caused by environmental conditions in the 20th century could have also prevailed back during times like the Medieval Warm Period (MWP) some 800-1000 years in the past. If this were the case, then the concern raised by some at the workshop would be justified. However, the available evidence does not support such a conclusion. In a paper I published in Quaternary Science Reviews in 2004 (Cook et al., 2004), I reviewed the properties and interpretation of the tree-ring data used in the Esper et al. (2002) paper published in Science. The reasonably well distributed set of tree-ring data in both boreal and more temperate latitude sites around the Northern Hemisphere allowed me to split up the data into sub-regional ensembles, including 8 sites in the 55-70° north band and 6 sites in the 30-55° south band. The purpose was to demonstrate the overall robustness of the multi-centennial temperature signal in the tree-ring data. This plot from the QSR paper is embedded below and the paper is sent being sent as an attachment. The importance of this plot to the "divergence" debate follows next.

In their paper, Briffa et al. (1998) showed that the "divergence" between tree growth and

temperatures was largely restricted to the region covered by the north band described in Cook et al. (2004). Consistent with that finding, the north ensemble mean shown below (blue curve) reveals a serious downturn in growth after about 1950. This is an expression of the large-scale "divergence" described by Briffa et al. (1998) and also by Dr. D'Arrigo in her NRC talk. In contrast, the south ensemble mean (red curve) shows the opposite growth trajectory after 1950, i.e. a substantial growth increase that is much more consistent with 20th century warming. If one then follows the plots back in time, all sub-region ensemble means track each other remarkably well at multi-centennial time scales even when they enter the putative MWP 800-1000 years ago. In fact, at no time prior to the 20th century is there a separation between north and south that is at all comparable to that found after 1950. This result indicates that no large-scale "divergence" of the order found during the 20th century occurred during the MWP even though that period is suggested to have been somewhat warmer than average overall. It thus refutes the argument that "divergence" of the kind found in the 20th century could very well have happened in the past, thus implying that tree rings cannot produce reliable reconstructions of past temperatures. It also supports the existence of an admittedly unknown anthropogenic cause of the 20th century "divergence". The lack of any known cause is unfortunate, but this would be true regardless of how the importance of "divergence" is interpreted.

I am not aware of ANY evidence that demonstrates the occurrence of large-scale "divergence" between tree growth and climate prior to the 20th century. Indeed, the available evidence indicates just the opposite. In my opinion it is therefore unjustified to call into question the use of tree rings for reconstructing temperatures over the past millennium based on a naïve and inappropriate extrapolation of the growth "divergence" problem into the past when it appears to be unique to the 20th century. The NRC committee members must consider this in their report if it is to have the necessary scientific credibility that is expected of it.

Sounds good Martin. Keith, Tim - are you out there? Please help by ensuring we're doing the right thing w Fig 6.13 and table 6.2

Hi Peck
Thanks for the provisional "go ahead" - we can (and so will) wait till Monday before changing the master copy of the chapter here.
Regards
Martin

Dear Jonathan
Thanks for trying to sort this out quickly for us and for the information that the Ammann et al paper is not available.
Susan and I have discussed your two options and have to say that we can not agree to option 1 in the circumstances. Although the Jones and Mann (2004) paper shows the NCAR simulation, the key point is that it cites it as "C. Ammann et al private communication 2003". So in effect option 1 would be bringing in material that was not peer reviewed and not even separately documented. Anyone wanting to discredit your chapter would

highlight the fact that you appear to be depending on work done in 2003 that had still not been peer-reviewed.

Option 2 is the only way to meet the standard that we have set all along of basing the assessment very firmly on peer reviewed literature.

Kristen Averyt found that she could edit the EPS files that you had sent us earlier for

Fig 6.13 and take out the curves in question labelled AJS2006. The result is attached.

If you can confirm that this edited figure looks correct we are now proposing to drop

that into your chapter in place of the original one. We would also remove the [S4] row

in Table 6.2 referring to this study. We would also of course use the edited version of

the figure in the TS (Fig TS-26 in current draft).

If you can see any other implications of this approach to resolving the problem that we

need to be aware of please let me know. If the author team wants to provide a redrawn

figure that might be an improvement on the attached version we can still wait until

Monday morning for that.

Best regards

Martin

At 04:25 PM 3/22/2006, Jonathan Overpeck wrote:

Hi Keith and Tim - need FAST help. Figure 6.13, and Table 6.2 cite Amman et al., for the

CSM curve. Since this paper doesn't yet exist in "in press" form (I checked w/ Bette,

who is a co-author), we have two choices. I think choice one below could be ok, but want

to have confirmation from Keith or Tim, and if it's not ok, (NOTE) Tim and Keith need to

get new Fig and Table to Melinda and Martin at the TSU by Monday.

Option 1: we can cite Jones, P.D., and M.E. Mann, 2004: Climate over past millennia.

Reviews of Geophysics, 42(2) - this paper (already in references - there is hope!) has

the CSM simulation in its Fig 8, but of course it's not the idea original reference

describing the simulation.

Option 2: we (Tim) creates new fig 6.13, and Table 6.2 without any reference to this

simulation.

PLEASE NOTE - if Keith and Tim (or Martin) feels we must go w/ option 2, Tim has to send

the new fig and table to TSU (Melinda Marguis and Martin) by Monday AM at the absolute

latest.

Thanks for your quick help, Peck

<x-flowed>
Dear all,

we (Keith and I) agree that it isn't appropriate to cite only Jones and Mann (2004) as a reference for the NCAR CSM curves in figure 6.13.

Another alternative to deleting the curves, however, would be to reference Mann, Rutherford, Wahl and Ammann (2005), which should already be in the reference list. This might be an appropriate reference because it includes Ammann as a co-author and provides a more information about the simulation than Jones and Mann (2004). However it still relies upon the submitted Ammann et al. paper as the main reference -- so maybe still not good enough? I've attached a PDF of Mann et al. (2005) for you to consider.

From earlier discussions (and perhaps also in relation to chapters using new model runs of future climate), I thought that a new unpublished run with an existing published model under published forcing might be allowed (in the same way that updated 2005 or 2006 instrumental temperatures could be included, even if not published, providing they were compiled following the procedures described in an earlier paper). For instance, the EMIC runs we included as an extra panel probably fall in this category. Maybe the CSM run falls in this category too? Have other runs with this model been published? And the forcing used in this run was presented in Goosse et al. (2005; GRL 32, L06710, again it includes Ammann as a co-author) as well as in Jones and Mann (2004). So, maybe CSM can be included under this reasoning?

I don't want to sound as if we are arguing strenuously to keep the CSM curves in the figure -- if the preferred decision is to drop it, then so be it. If so, then the modified figure looks ok.

Cheers

Tim

We (Tim Osborn and Keith Briffa) will first respond to these specific questions about our recent Science paper. In addition, copied below are some further comments by Keith Briffa on issues related to tree-ring proxy records, that may be of interest to the committee.

The primary purpose of our paper was to implement an alternative, and possibly complementary, method of proxy-data analysis to the methods used in most previously published reconstructions of past NH temperature variations. We did not want to introduce an entirely new selection of proxy records (even if this were possible), because that would obscure whether differences in our conclusions, compared with published work, arose from our method or a different selection of proxy records.

We decided, therefore, to make use of as many of the individual records used in almost all the previously published NH temperature reconstructions, excluding any records for which an indication of at least partial temperature sensitivity was lacking. So, very low resolution records for which comparison with instrumental temperatures is problematic were excluded.

We used records specifically from Mann and Jones (2003) and Esper et al. (2002). In addition we included records from Mann et al. (2003), which I think just adds the van Engelen documentary record from the Low Countries in Europe, because the others were already in the Mann and Jones set. We excluded duplicates, and our paper explains which series we used where duplicates were present. We did not average the Tornetrask, Yamal and Taimyr tree-ring records as done by Mann and Jones, because we could see no reason not to use them as individual series.

The series used by Mann and Jones had already been correlated with their local instrumental temperatures -- using decadal-smoothed, non-detrended, values -- so we accepted this as an indication of some temperature sensitivity. For the other series, we calculated our own correlations against local instrumental temperatures, trying both annual-mean or summer-mean temperatures. In our paper's supplementary information, we state that we used the HadCRUT2 temperatures for this purpose, which combines land air temperatures with SST observations. In fact, we used the CRUTEM2 land-only temperature data set for this purpose. These should be identical where the proxy locations are not coastal. For these correlations, we did not filter the data, nor did we detrend it, and we used the *full* period of overlap between the proxy record and the available instrumental record.

We excluded records that did not show a *positive* correlation with their local temperatures. The remaining set includes most of the long, high resolution records used by others, such as Moberg et al., Crowley and Lowery, Hegerl et al., Mann, Bradley and Hughes, etc. as well as by Mann and Jones and Esper et al.

The final question, regarding the selection method favouring records that show a strong 20th century warming trend, is a more philosophical issue. As stated above, we did not actually use strongly selective criteria, preferring to use those records that others had previously used and only eliminating those that were clearly lacking in temperature sensitivity. To some extent,

therefore, the question is then directed towards the studies whose selection of data we used. Certainly we did not look through a whole host of possibilities and just pick those with a strong upward trend in the last century! And we don't think the scientists whose work we selected from would have done this either. There are very few series to choose from that are >500 years long and are from proxy types/locations where temperature sensitivity might be expected. It would be entirely the wrong impression to think that there are 140 such a priori suitable possible series, and that we picked (either explicitly or implicitly) just those 10% that happened by chance to exhibit upward 20th century trends.

The correlation with local temperature is an entirely appropriate factor to consider when selecting data; these could be computed using detrended data, though for those that we calculated, our use of unfiltered data means that the trend is unlikely to dominate the correlation. One would need to inspect the trend in the temperature data at each location to evaluate how much influence it would have on the results; but in locations where a strong upward trend is present, it would be right to exclude proxy records that did not reproduce it, though also correct that a proxy shouldn't be included solely on the basis of it having the trend, especially where the proxy resolution is sufficient to test its ability to capture shorter term fluctuations.

Finally, note that our method has not selected only those records with a strong 20th century warming trend. Of the 14 proxies selected (see our figure 1), 7(!) do not have strong upward 20th century trends: Quebec, Chesapeake Bay, W Greenland, Tirol, Tornetrask, Mangazeya, and Taimyr. Our method gives equal weight to all records, so it should not be biased towards a single record, or a small number of records, that do show strong upward trends.

Here are the additional comments on tree-ring issues:

I would also like to take the opportunity, if you will allow, to comment briefly on some reports that have reached me concerning the contribution made by Rosanne D'Arrigo to your Committee. Apparently, this is being interpreted by some as reflecting adversely on the validity of numerous temperature reconstructions that involve significant dependence on tree-ring data. This is related to Rosanne's focus in her presentation on the apparent difference between measured temperatures and tree growth in recent decades - a so-called "divergence" problem.

First let me make it clear that as I did not attend the Committee meeting I am not able to comment specifically on the details of Rosanne D'Arrigo's actual presentation, though I am aware of her papers with various co-authors related to this "divergence" in the recent (circa post 1970) trends in tree-growth and temperature changes as recorded in instrumental data, at near tree-line sites in the Canadian Arctic. There are also other papers dealing with 'changing growth responses' to climate in North American trees.

I have co-authored a paper in Nature on the reduced response to warming as seen in tree-ring densitometric data at high-latitude sites around the Northern Hemisphere, increasingly apparent in the last 30 years or so.

First, it is important to note that the phenomena is complicated because it is not clearly identifiable as a ubiquitous problem. Rather it is a mix of possible regionally distinct indications, a possible mix of phenomena that is almost certainly in part due to the methodological aspects of the way tree-ring series are produced. This applies to my own work, but also very likely to other work.

The implications at this stage for the 'hockey stick' and other reconstructions are not great. That is because virtually all long tree-ring reconstructions that contribute to the various reconstructions, are NOT affected by this. Most show good coherence with temperature at local levels in recent decades. This is not true for one series (based on the density data). As these are our data, I am able to say that initial unpublished work will show that the "problem" can be mitigated with the use of new, and again unpublished, chronology construction methods.

In the case of the work by Rosanne and colleagues, I offer my educated opinion that the phenomenon they describe is likely also, at least in part, a chronology construction issue. I am not saying that this is a full explanation, and certainly there is the possibility of increased moisture stress on these trees, but at present the issue is still being defined and explored. As the issue needs more work, this is only an opinion, and until there is peer-reviewed and published evidence as to the degree of methodological uncertainty , it is not appropriate to criticize this or other work . For my part, I have been very busy, lately with teaching and IPCC commitments, but we will do some work on this now, though again lack of funds to support

a research assistant do not help.

The matter is important but I do not believe that the facts yet support Rosanne's contention, in her Global Biogeochemical Cycles paper (Vol. 18, GB3021, doi:10.1029/2004GB002249, 2004) that an optimum physiological threshold has been consistently exceeded at a site in the Yukon. This conclusion should certainly not be taken as indicating a widespread threshold exceedence.

It was my call not to "overplay" the importance of the divergence issue, knowing the subtlety of the issues, in the forthcoming IPCC Chapter 6 draft. We did always intend to have a brief section about the assumption of uniformitarianism in proxy interpretation , including mention of the possible direct carbon dioxide fertilization effect on tree growth (equally controversial), but it is likely to conclude that here as well , there is no strong evidence of any major real-world effect. This and the divergence problem are not well defined, sufficiently studied, or quantified to be worthy of too much concern at this point. The uncertainty estimates we calibrate when interpreting many tree-ring series will likely incorporate the possibility of some bias in our estimates of past warmth, but these are wide anyway. This does not mean that temperatures were necessarily at the upper extreme of the reconstruction uncertainty range 1000 years ago, any more than they may have been at the bottom. The real problem is a lack of widespread (and non-terrestrial) proxies for defining the level of early warmth, and the vital need to up-date and study the responses of proxies in very recent times.

Best regards,

Tim Osborn and Keith Briffa

Tim,

yes, I also found it strange. We noticed that Amman and Wahl cited their Science comment as accepted in their manuscript that is now in press in Climatic Change.

Personally I think it is convenient that this clarification gets published but I am somewhat disapointed by the fact that a very similar content was submitted by Buerger and Cubasch about one year ago and it was not even sent to reviewers (it is the paper that finally appeared in Tellus). I think that comment was of much higher quality than Wahl's.

Science knew of the Tellus paper, since we cite it in our response. So actually there is scientifically nothing new in this exchange, but it will be published in Science...

Anyway, I am happy to have more time now for more productive work and hope that Ritson doe not bomb me with more mails in the future

From: Tim Osborn <t.osborn@uea.ac.uk>
To: "Brooks Hanson" <bhanson@aaas.org>
Subject: Re: data request to SCIENCE for 1120514
Date: Fri, 31 Mar 2006 10:30:06 +0100
Cc: "Jesse Smith" <hjsmith@aaas.org>, Keith Briffa <k.briffa@uea.ac.uk>

<x-flowed>

Dear Brooks Hanson,

of the two additional questions/requests, the first one is quick to respond to and so I can do that immediately.

In fact my previous reply answers the first question already, as does our paper itself in a very clear way. It is something of a waste of time, therefore, to have to write another answer, but here goes anyway...

We clearly state (in the SOM to our paper) what the data sources were, and Esper et al. was not the source for the four series in question. There is, therefore, no need for anyone to "surmise" that this is the case, because we explicitly state it!

Further, we state in our paragraph (d) that we replaced Athabasca with a new, "better-replicated series" from Luckman and Wilson. "Better-replicated" clearly indicates that there are more data in the new series than were available to Esper et al., as is also clear from even a cursory read of the Luckman and Wilson paper. So it should be obvious that you cannot expect to reproduce the results using the fuller data set by using only the more limited data available from Esper et al. -- otherwise what would be the point of going out and collecting all that new data?

The other three series are covered in our paragraph (c), "The data sets contain some non-identical tree-ring series derived from the same sites; we have favoured series from (S3) because they are based on a greater number of tree core measurements than the series generated by (S1)". So we clearly did not use the Esper et al. data (S1) and it should also be clear that the series we did use can not be reproduced using the Esper et al. data because they are "non-identical" and there are fewer tree cores in the Esper et al. data. The source we gave for these three series is Briffa (2000).

We did not use tree-core measurement data in our paper, only

chronologies that had previously been assembled by others from core measurement data. I don't have any core measurement data and therefore have none to give out! And in my first reply I explained why I didn't think that this was appropriate anyway, since I consider that our obligation is limited to providing data to allow the replication of the steps reported in our paper, none of which involved any processing of core measurement data.

I will reply next week regarding the second question/request.

Best regards

Tim

Hi Eystein,

not sure if I comprehend the mentality of not sending a statement, keeping a low profile I do not perceive a good strategy. I am mentioning this as I have become increasingly weary of FWP programmes and proposals. Over the past four years I was involved in 4 initiatives none of which came through. Beyond the immediate frustration on the basis of the individual failures I do note in all these instances is an unfavourable degree of ambiguity in the reviewing process such that it appears the reviewers are being kept in the dark about the vision of the call beyond what the call says in printing. I can see the challenge from the programme managerial side that one wishes not to interfere with the reviewing progress and yet I feel that the reviews offered, perhaps the reviewing process at large, do not live up to the standards set for proposals. Quite frankly, from my few conversations I had with the programme managers and their assistants I have come to the conclusion that they are helpful in providing assistance with logistics and proposal structuring, yet on a managerial front they are not up to speed with what I would perceive professionalism in handling their tasks. So to me it seems there are various levels involved in the issue that in the end mount to the impression that FWPs are not an immediate option for proposals much longer. This view is shared by quite a number of colleagues and it is for this reason that I am convince we must respond to the Imprint failing.

If Keith doesn't mind perhaps forward the statement so I can glance through it.

Best, Rainer

<x-flowed>

Hi Henry - thanks for the email. Just earlier today, Eystein and I were soliciting approval from our team on how to best get feedback from chapter authors - Lead Authors and Contributing Authors alike. Since we're all authors, it isn't appropriate to comment officially as expert reviewers, but rather to work as a team to take expert reviews - AND chapter 6 author feedback - and use them to create a better final draft. One key, as promised earlier, is to have a process that makes sure we get all comments and are able to respond to them. The other key is that we ensure time to allow the needed debate. Eystein and I are going to ask LAs (including Keith) to do their work sooner in the draft cycle than before so that we have the time for this.

So... I would suggest you keep these comments in a safe place for a bit longer, and then send them in to the Eystein and I when we ask (should be in the next week). Note that the current draft has only officially been available for a bit over a week (indeed, I didn't see it until today since the IPCC TSU had to check for all sorts of things after we submitted it over a month ago), and we won't be working on the new draft until June. So we have time to be thoughtful and complete in the feedback gathering process.

Is this ok? Seems more suitable than giving review via the gov process on your own work (you are an author of our chapter).

Also, I can anticipate one thing that is going to come up again, and that I don't think we had your

feedback on (nor Keith's). What about the borehole recons that you and colleagues have done extending back beyond the last couple centuries. I don't have my paper pdf collection here, but I believe you have some recons going back many centuries. Does this need more attention in the chapter?

Thanks for being proactive and quick to send feedback. We'll be sending our email to all CA's soon, if you're willing to wait a couple more days.

Thanks, peck

thanks Tim,

I'm saddened to hear that this bozo is bothering you too, in addition to NCAR, NSF, NAS, IPCC and everyone else. Rest assured that I won't ever respond to McIntyre should he ever contact me, but I will forward you any email he sends related to this. I assume Scott feels the same way...

I hope you're having as nice a spring as we are here. See you in June?

mike

p.s. we have some interesting new reconstruction based on RegEM using a greatly expanded multiproxy network (which includes the MXD data). I hope to send you guys shortly. It is our hope that you'll consider being co-authors. This to come soon...

Subject: Re: Standardisation uncertainty for tree-ring series
Cc: Keith Briffa <k.briffa@uea.ac.uk>,simon.tett@metoffice.gov.uk

Hi Philip,

we have three "groups" of trees:

"SCAND" (which includes the Tornetrask and Finland multi-millennial chronologies, but also some shorter chronologies from the same region). These trees fall mainly within the 3 boxes centred at:

17.5E, 67.5N

22.5E, 67.5N

27.5E, 67.5N

"URALS" (which includes the Yamal and Polar Urals long chronologies, plus other shorter ones). These fall mainly within these 3 boxes:

52.5E, 67.5N

62.5E, 62.5N (note this is the only one not at 67.5N)

67.5E, 67.5N

"TAIMYR" (which includes the Taimyr long chronology, plus other shorter ones). These fall mainly within these 4 boxes:

87.5E, 67.5N

102.5E, 67.5N

112.5E, 67.5N

122.5E, 67.5N

We do some analysis at the group scale, and for this we take the JJA temperatures from each box and average to the group scale to obtain a single series from each of SCAND, URALS and TAIMY.

We do some analysis at the overall scale, and for this we take these three group temperature series and average them to get an overall NW Eurasia temperature for boxes with tree chronologies in them.

We did also try using a wider average for the region, including all LAND temperatures from grid boxes within a rectangular region from 12.5E to 127.5E and from 57.5N to 72.5N, but I don't think it correlated so well against the tree-ring width data (I can't remember the exact correlations), so we didn't pursue that.

Does that give you enough information to be going on with? I'd recommend using CRUTEM3 rather than HadCRUT3, because the correlations seem to deteriorate with the inclusion of

SST data in some cases -- though of course you can look into this yourself.

Cheers

Tim

At 16:35 27/04/2006, philip.brohan@metoffice.gov.uk wrote:

Thanks Tim.

I need to extract from the instrumental and model data the appropriate data to calibrate the tree-rings against. Presumably this is the June-July-August average land surface temperature for a particular region in NW Eurasia. Could you send me the lat and long ranges of the region?

Cheers,

Philip

Subject: Wengen meeting
Date: Wed, 03 May 2006 23:31:00 +0200 (MET DST)

Dear Tim, dear Keith,

I am writing to inform you that I have reconsidered my acceptance to attend the Wengen meeting. In the last days I have convinced myself that under the present circumstances a constructive discussion on reconstruction methods is unfortunately not possible. We have another exchange on the last Journal of Climate paper by Mann et al, which is now under review. Even the editor of J. of Climate found adequate to tell us that all inflammatory comments in their response would have to be eventually deleted. Even considering the considerable pressure that he has is exposed to in American politics, I think Michael Mann is unable of any constructive discussion.

I am very grateful for your invitation to this meeting and I hope that we can continue our collaboration in other ocasion.

Best wishes

eduardo

Subject: Re: ipcc chapter 6 draft

Date: Thu, 18 May 2006 15:58:25 -0600

Cc: Keith Briffa <k.briffa@uea.ac.uk>, Eystein Jansen <eystein.jansen@geo.uib.no>

<x-flowed>

Hi Neil - Thanks for your interest in providing feedback on the draft chap 6 Second Order Draft. Since the IPCC has very strict rules about all this, I'm going to ask them (the IPCC) to send you an official invitation to review, along with the process - formal, but highly efficient - to follow. If you could send your comments in that way it would be a great help. We've been asked to keep everything squeaky clean, and not to get comments informally.

Thanks! Peck

>Dear Jonathan

Hi Gene - thanks for the update. If Tim/Keith/Caspar want to add anything (or Martin ask for more clarification), please cc to the entire list on this email. Sounds like the UCAR version is the one to consider "official" (right everyone?).

Thanks again, Peck

Dear Peck et al

Thanks for clearing this up. The bottom line is that the version of this paper on the UCAR site is fine. Unfortunately though, the one we have on the IPCC WG1 web site is not!

I am attaching a copy of that for clarity. The metadata in this PDF file indicate that it was created by Oyvind Paasche from a Word document in early March when we were asking the chapter teams to provide copies of the unpublished literature. It seems that Oyvind worked from an earlier and significantly shorter version - less text, fewer tables and the figures are different - as you can see in the attached. Although to repeat my earlier statement the conclusions of this earlier draft do not appear to me to be substantially different.

Based on what we now know, the TSU should add the NCAR version of the paper to our review web site and we will do that today.

Thanks

Martin

Subject: Re: Wahl & Amman paper

Hi Martin - We'll look into this asap. I'll cc to Caspar and Gene to see if they can clarify the situation and make sure we have the correct version. I'll also cc Bette since she may see Caspar around NCAR and make sure he know's we are trying to clarify things with his paper.

More soon, thx, Peck

Dear Eystein and Jonathan

It has been pointed out to us by a reviewer that the version of the Wahl and Amman paper (accepted by Climatic Change) on our review web site differs from the version that is available publicly from the NCAR web site at:

[

[2]http://www.cgd.ucar.edu/ccr/ammann/millennium/refs/WahlAmmann_ClimaticChange_inPress.pdf

<[3]http://www.cgd.ucar.edu/ccr/ammann/millennium/refs/WahlAmmann_ClimaticChange_inPress.pdf>]

Although the differences are not (in my view) substantial, the paper on the NCAR web site is apparently dated Feb 24th (i.e. before the date of final submission of the SOD), it has additional figures and data, and the running header says "Feb 24, in press".

Could you please clarify which of the two versions of this paper would reflect most accurately the status of the paper as used by the Chapter 6 team when preparing the SOD. That has been our basis for deciding on which version to include on our reviewer web pages up until now, but we are now reconsidering whether to also include updated versions of unpublished papers as well. If you have any thoughts on that please let me know.

Best regards
Martin

Hello all:

Yes, Martin, the paper you sent today is indeed an old version, and should be replaced by the NCAR pdf version.

This old version sent today is actually older than the Feb 21 version I mentioned yesterday (see below), and has no relevance in terms of the text that is accepted/in press with Climatic Change as of February 28, 2006.

As I mentioned yesterday (see below), the text of the UCAR pdf is identical to the WORD version I sent to Peck, Keith, and Eystein on February 24.

Peace, Gene

[Note: I would have sent the graphics separately with these versions, and I did not keep copies of the sent files in my email account -- to deal with memory limits in the system here. Thus, I cannot confirm exactly which graphic files are associated with the February 24 version. My apologies.]

In summary, the UCAR website pdf document should be considered the official one that is "accepted/in press". Formal notification of acceptance from Stephen Schneider at Climatic Change came on February 28. The article is still in this status.

Let me know if I can help clarify things futher. Please note that I will be in Boulder starting May 27, to be a visiting scholar at NCAR for a month. I will be keeping up with email from there.

Subject: Re: Wahl & Amman paper

Hi Martin - We'll look into this asap. I'll cc to Caspar and Gene to see if they can clarify the situation and make sure we have the correct version. I'll also cc Bette since she may see Caspar around NCAR and make sure he know's we are trying to clarify things with his paper.

More soon, thx, Peck

Dear Eystein and Jonathan

It has been pointed out to us by a reviewer that the version of the Wahl and Amman paper (accepted by Climatic Change) on our review web site differs from the version that is available publicly from the NCAR web site at:

[

[2]http://www.cgd.ucar.edu/ccr/ammann/millennium/refs/WahlAmmann_ClimaticChange_inPress.pdf

<[3]http://www.cgd.ucar.edu/ccr/ammann/millennium/refs/WahlAmmann_ClimaticChange_inPress.pdf

>]

Although the differences are not (in my view) substantial, the paper on the NCAR web site is apparently dated Feb 24th (i.e. before the date of final submission of the SOD), it has additional figures and data, and the running header says "Feb 24, in press".

Could you please clarify which of the two versions of this paper would reflect most accurately the status of the paper as used by the Chapter 6 team when preparing the SOD. That has been our basis for deciding on which version to include on our reviewer web pages up until now, but we are now reconsidering whether to also include updated versions of unpublished papers as well. If you have any thoughts on that please let me know.

Best regards

Martin

Hi Mike

thanks for these comments and especially thanks for your remarks on the effort of trying to produce a balanced picture of the current state of things in the IPCC Chapter 6. In fact , I know that it is already out of date and I am going to get particularly lambasted for not discussing problems with recent tree responses to warming and potential problems wit CO2 fertilization - I may have to add even more text yet .You are absolutely correct that we had unreasonable trouble from Susan , who was not as "hands off" as she might have been. I will certainly study your comments carefully - as I always do . I would rather reserve comment on the Crowley reconstruction til I speak personally to you. I really hope that we can get an atmosphere of constructive discussion that , I believe, must include some discussion of the sceptics . Look forward to those drinks and some time away from the mad house of teaching/exam marking etc. See you soon

best wishes

Keith

Hi Keith,

I wanted you to have an advance copy of the comments I'll be submitting on the final draft of the AR4. I commend you for the excellent work you've done and the tough battle I know you have had to fight. I don't envy it, and you know the tough battles I've been through.

Confidentially, I do have a number of specific concerns mostly in the area of discussions of where things actually now stand in terms of some of the earlier criticisms. I believe that the discussion is still out of date, given what has been shown in recent publications, including Wahl and Ammann (Science). Also, and I don't think this is the only place you're going to hear this from, there are deep problems w/ Hegerl et al '06, particularly the claims of what TLS can do, which are egregiously incorrect. There is a comment in review in Nature (not me, but I can promise you, by someone who understands the statistical issues involved better than anyone else in our community) that is very critical. I think its unwise for the TAR to uncritically accept the claims made, particularly given that the actual J. Climate paper was in limbo at least at the time the most recent draft was finalized. I believe that disqualifies it for consideration for AR4, no?

Also, I think it is an absolute travesty that figure 6.10 isn't being shown in the SPM. I think that is unforgiveable, and there should be an effort to over-ride that decision (I would suspect that is Susan Solomon's doing?),

I hope we can discuss these things (and much else) over a few beers in Switzerland.

Looking forward to seeing you soon,
mike

Hi John - thanks. I'll cc to Keith and Tim too, and we'll be sure to discuss these in Bergen. I'll be on my normal email to the extent we have time to be check email - experience suggests it's tough. But... we'll try to keep an eye on email.

See you soon, best, peck

Hi Eystein, Jon,

I am in Geneva at the WMO EC meeting,so I have not had a lot of time to look at the SOD comments. I can not get to Bergen before Tuesday. I had a quick look at the comments on the hockey stick and include below the questions I think need to be addressed which I hope will help the discussions. I do tbelieve we need a clear answer to the skeptics . I have also copied these comments to Jean. Please let me know that you have received this, and what email address I can contact you at in Bergen".

With best wishes

John

1. There needs to be a clear statement of why the instrumental and proxy data are shown on the same graph. The issue of why we dont show the proxy data for the last few decades (they dont show continued warming) but assume that they are valid for early warm periods needs to be explained.

2. There are number of methodological issues which need a clear response. There are two aspects to this. First, in relation to the TAR and MBA which seems to be the obsession of certain reviewers. Secondly (and this I believe this is the main priority for us) in relation to conclusions we make in the chapter We should make it clear where our comments apply to only MBH (if that is appropriate), and where they apply to the overall findings of the chapter. Our response should consider all the issues for both MBH and the overall chapter conclusions

a. The role of bristlecone pine data

Is it reliable?

Is it necessary to include this data to arrive at the conclusion that recent warmth is unprecedented?

b. Is the PCA approach robust? Are the results statistically significant? It seems to me that in the case of MBH the answer in each is no. It is not clear how robust and significant the more recent approaches are.

3. The chapter notes that new data has been included, but we dont say how much or is this is substantial or minor. The impression I have that the amount added is minor, but I cant tell.

4. The Esper et al and Moburg et al data both show increased variance, but the temporal patterns are quite different. We need to say why the discrepancy does not undermine our conclusions of greater cooling in the Little Ice Age.

5. I have not had time to check the original chapter, but the comments give the impression that the recent 50 yr warming is unprecedented over the last 500years (seems reasonable) and elsewhere over the last 1000years (less clear)

Subject: report back from PAGES/CLIVAR Wengen meeting
Date: Fri Jun 23 16:35:28 2006
Cc: Keith Briffa <k.briffa@uea.ac.uk>

Hi Simon, Philip, Eduardo & Gerd (cc Keith),

I thought you might be interested in a brief report back from the recent Wengen meeting, specifically about how SO&P-funded work on pseudo-proxies was covered and related hockey-stick issues.

****Please don't circulate this further, because it is just my personal viewpoint****

Thanks for letting me show some of your material. I skipped over some graphs I took from Philip's regression presentation at the SO&P meeting because Francis Zwiers covered forward/inverse/total least squares before me. I did show some results from Eduardo, including pseudo-proxy results from Erik-II. And I showed a figure from Gerd's "many flavours" pseudo-proxy paper.

The meeting included fairly intensive discussions about many issues, and this included some discussion of von Storch et al. (2004, 2006), Wahl et al. (2006), Mann et al. (2005), Burger and Cubasch (2005) and Burger et al. (2006). Generally the discussion was quite open, with only a few disdainful remarks made about the work of people not there -- certainly not enough to distract from useful discussions.

In general, most people accepted that the MBH method could, in some situations, result in biased reconstructions with too little low-frequency. I'm not sure how much Mike Mann accepted this, but it was reinforced by findings shown by Eugene Wahl that indicated some bias in their CSM pseudo-proxy studies, and particularly by Francis Zwiers who looked to have almost completely replicated the von Storch et al. results with respect to the MBH method (though he emphasised the preliminary nature of his work and he may not have implemented the MBH method correctly... we'll have to wait and see).

Mike showed many detailed psuedo-proxy tests of the RegEM method and these seemed quite convincing in showing little problem with that method... it does assume equal error in both instrumental and proxies, so it should show less bias than other methods that wrongly put all the error in the instrumental record (i.e., "typical" regression).

So... there was some confusion about how the MBH method can be biased but the RegEM not be biased (in pseudo-proxy tests) yet they give the same results for the real proxies.

Mike thought it might be the ECHO-G vs CSM differences, but I argued against this and was supported by Caspar Ammann and Eugene Wahl who did

not think that the character of the model runs was a big factor in explaining different results.

There was limited discussion of trend/detrend and white/red noise pseudo-proxy issues. Many seemed to think that if pseudo-proxy studies showed that detrending definitely caused a problem, then this was a reason not to detrend. The alternative of finding a method that worked with detrended data was not really discussed.

The discussion was fairly constructive and for the most part friendly. Eugene Wahl in particular seemed keen to "build bridges" within the community.

I should also mention two of the workshop outcomes.

The first is that a paper is being planned based on the things discussed at the workshop and covering many issues from proxy data, forcings, model simulations and reconstructions. I hope that the authorship of this might be wider than just the participants of the workshop, but we will have to wait and see who else is asked to contribute.

The second is that we should set up a "climate reconstruction challenge". The idea would be to use a simulation (*not* of the last 1000 years, so none of us know the expected answer) and provide some data from a "calibration period" and some "pseudo-proxies" from the full period and make these public so that anyone could attempt to make a reconstruction using their favoured method(s). The true model NH temperature series would be kept secret for 6 months or so. Thus it would be a "blind" test and after attempts had been submitted they would be evaluated against the true result to assess which methods were most successful.

Caspar Ammann will probably provide the simulation, so he wouldn't take part in making any reconstructions. He would keep the details secret from all others so that any one, including MBH, you and us, could enter the challenge.

Finally, it was asked whether the model runs that have so far been used for pseudo-proxy studies (NCAR CSM, ECHO-G Erik-I, HadCM3, maybe ECHO-G Erik-II?) might be made publicly available for shared use, so results are less model dependent. This would just be the surface air temperature fields from the runs, not all the other variables. What do you think, Simon and Eduardo? If you are happy with this then they could get them from the SO&P website, so no need for data extraction on your part.

Hope you find this summary interesting. It's just my opinions. I've cc'd this to Keith in case he wants to say anything different!

Cheers

Tim

Hi Christoph,
sounds excellent. 20th is a good target with three weeks left. Let me launch one full round to solicit comments and ideas, and then I can send you what we have to build the web site. I'll check with Mike about having him fold this into the report.
Cheers
Caspar

Dear Keith,

I hope that you had a good trip back from Bergen.

Some of the review comments which appeared to be relevant for the Holocene section are yours. I copy them here so that you can take there of them.

All the best,

Valérie.

Fig. 6.10a. Rather than showing the average of 4 European stations I suggest to plot the available averaged European mean land temperature (using much more than just 4 stations) from Luterbacher et al. 2004 and Xoplaki et al. 2005. This continental scale average would provide a more

appropriate overview for the last 250 years. The first lead author has the data or they can be obtained prepared from xoplaki@giub.unibe.ch or juerg@giub.unibe.ch. Xoplaki, E., Luterbacher, J., Paeth, H., Dietrich, D., Steiner N., Grosjean, M., and Wanner, H., 2005: European spring and autumn temperature variability and change of extremes over the last half millennium, *Geophys. Res. Lett.*, 32, L15713. Luterbacher, J., Dietrich, D., Xoplaki, E., Grosjean, M., and H. Wanner, 2004: European seasonal and annual temperature variability, trends and extremes since 1500, *Science*, 303, 1499-1503.

27:0

Fig 6.10. I here repeat a point made in my comments on the FOD. It is statistically invalid and visually misleading to overlay the black instrumental line on this diagram. The coloured graph lines show proxy records that end at 1980. If you want a line that continues up to more recent years that then you must use the proxy records that continue past 1980, not switch to a different type of series. There are up to date proxy records available, but as I'm sure the authors of this chapter are aware, they depart from the surface instrumental record, many of them declining after 1980. By failing to show this, and including the surface temperature data in black, it constitutes a misrepresentation, since the black line is an invalid forward extrapolation of the proxy data. If the reason for not showing the updated proxies is that they are not considered to be good representatives of temperature anymore, then by what right does the Figure insinuate that they were good proxies 8-10 centuries ago? It is no defence to claim that MBH99 established a statistically skillful relationship between the proxy network and the instrumental data, since that claim has been refuted, as discussed

above. McIntyre and McKittrick (2005a,d) showed that the pre-1450 RE statistic was incorrectly benchmarked, yielding a spurious inference, and the r2 stat calculated by MB&H themselves, which showed the lack of skill, was simply not reported. The failure of the r2 and CE stats is confirmed by Wahl and Ammann. The squared correlation between the MBH long proxies and the instrumental record is nearly zero (MM05a,c). The mean correlation between the long NOAMER proxies and gridcell temperatures in the MBH98 data set (which dominate the pre-AD1450 portion) is -0.08 (McIntyre and McKittrick 2005c), and the RE significance benchmark is above the MBH98 RE score, using all available implementation of the Mann code (McIntyre and McKittrick 2005d). The surface instrumental record cannot be used as a statistically valid extrapolation for the proxies after 1980.

To: Jonathan Overpeck <jto@u.arizona.edu>

Subject: Re: Borehole in the Southern Hemisphere

Date: Mon, 10 Jul 2006 16:36:08 -0400

Cc: Eystein Jansen <eystein.jansen@geo.uib.no>, Keith Briffa <k.briffa@uea.ac.uk>, Ricardo Villalba <ricardo@lab.cricyt.edu.ar>, Jason Smerdon <jsmerdon@ldeo.columbia.edu>

<x-flowed>

Hi Peck et al,

Thanks for your note about the Africa borehole reconstructions, along with the correspondence with Jason Smerdon. In my e-mail to you on April 18, 2006 I had indicated that the African work was unpublished. However, I had forgotten that the Nature paper by Huang, Pollack and Shen (Temperature trends over the past five centuries reconstructed from borehole temperatures, Nature 403, pp 756-758, 2000) actually showed the reconstructions for both southern Africa and Australia as bar graphs of century-long changes in Figure 3 of that paper. The figure displaying both the Africa and Australia borehole reconstructions that appears in the FAR draft (Figure 6.12? or was it 6.11?) shows temperature vs. time for five centuries, a display that differs from the bar-graphs in the Nature paper only in format, not data.

Inasmuch as there have been no additions to the datasets since that paper, it seems that we can correctly say that the reconstructions for southern Africa and Australia have both been published in the Nature (2000) paper. There is nothing "wrong" or outdated with either of those reconstructions. We have, in addition, a newer and more expansive paper about Australia alone (discussing the same reconstruction as appeared in the Nature paper), now in press in the Journal of Quaternary Science. This paper was already mentioned in the e-mail of April 18, 2006, which I will paste at the end of this message.

Other questions?

Cheers,
Henry

Subject: IPCC FAR draft

Headers: Show All Headers

Hi Keith (and Peck and Eystein),

I have recently been sent the current draft of the IPCC FAR by the US
Global Change

Research Program, asking for comments on the draft. This is the first
time I have seen

this product since we were feverishly exchanging e-mails in February.

Let me call to your

attention some small but not insignificant corrections to be made to
the next draft.

Page 6-33, Section 6.6.1.2, line 22. The title of this section (in
italics) should be
changed to "What do ground surface temperature reconstructions derived
from subsurface
temperature measurements tell us?"

Page 6-33, lines 49 and 52, there is a reference (Smerdon et al., in press).
This paper has now been published, so substitute "2006" for "in press",
and in the list
of references the citation should include the following:

J. Geophys. Res. 111, D07101, doi:10.1029/2004JD005578

Page 6-34, lines 43 and 44. This section is dealing with the southern
hemisphere. The
sentence "...these both indicate unusually warm conditions prevailing
in the 20th century
(Pollack and Smerdon, 2004)" , and the reference therein, are both incorrect.

The ground surface temperature changes over the last 500 years DO NOT
indicate unusually
warm conditions prevailing in the 20th century in Australia and
southern Africa. This is

because the unusually warm conditions developed late in the century, after most of the boreholes had already been logged. What the borehole reconstruction for Australia does show is very good correspondence with the Cook et al (2000) reconstruction for Tasmania and the Cook et al. (2002) recon for New Zealand. The Australia work is described in a manuscript "Five centuries of Climate Change in Australia: The View from Underground" by Pollack, Huang and Smerdon now under review in the Journal of Quaternary Science. The Africa work is unpublished.

Is this e-mail to you sufficient to activate these changes? Or should I submit these comments to the US Government Review Panel? If I am to submit to the latter, they require all comments to be filed by May 9.

Cheers,
Henry

Quoting Jonathan Overpeck <jto@u.arizona.edu>:

<x-flowed>

Hi again Henry - I've attached an 1997 paper of your's and wonder if you could shed some up-to-date insights on how to best interpret. In particular:

1) it has been pointed out to us that the result in this paper argue for a globally warm period during the middle Holocene that was warmer than today. Our assessment (i.e., Figure 6.9) indicates that there was likely no period during the Holocene that was warmer around the global than the late 20th century. Especially outside of the tropics, there were periods warmer than today during the Holocene, but these regionally warm periods were not synchronous - at least at the centennial scale we can examine with proxy data. Thus, although Huang et al. 1997, indicates greater mean annual global warmth, it was unlike the synchronous global warming of the late 20th century.

Plus, we believe the warmth of the Holocene was driven by orbital forcing, and that what we see makes sense in that regard. Huang et al, 1997 can be explained perhaps (this is a question) by the heavy borehole coverage in the Northern mid- to high-latitudes? We also know that proxy data shown in Fig 6.9 also indicate more warming (again, not synchronous) in Southern Hem mid-latitudes - where there are also many boreholes.

Obviously, another issue is that the boreholes don't give the same temporal resolution as the other proxy records we synthesized/assessed, and at least in your paper, there isn't regional information either.

So - the point is not (unless you suggest otherwise) that Huang et al 97 is wrong, but rather than within the limits of the data, it is compatible with what the higher-resolution, regionally-specific, multi-proxy data are showing in Fig 6.9, and that there was likely no period during the Holocene that was warmer synchronously around the

global than the during the late 20th century. Do you agree with this, and is our reasoning accurate and complete?

2) Huang et al 1997 also shows evidence for warmth within the last 500-1000 years that was greater than during the 20th century AND a cool minima 200 years ago. Both of these are highlighted in your abstract, and both seem incompatible with other evidence. For example, your own more recent work has shown the coolest temperatures to be about 500 years ago.

We didn't think it was within our focus to comment on these issues, but we are being asked to by reviewers, and it would be good to have your help in addressing these issues - hopefully in our responses to review comments rather than in our main text (which has to be shortened).

Many thanks for your help with this paper and the issues it raises.

Best, Peck

Subject: figure issues

Date: Fri, 14 Jul 2006 17:20:26 -0600

Cc: Valerie Masson-Delmotte <Valerie.Masson@cea.fr>

<x-flowed>

Hi all - including Eystein, whom I haven't been able to talk with on these issues yet:

1) I'd like to get your status report on Fig. 6.12 - based on feedback from Henry Pollack, we will keep the borehole curves and corresponding instrumental data. I believe we are also going to add the new recon from Law Dome - Valerie was going to send. Do you have everything needed for this figure revision?

2) Since we met in Bergen, I have received feedback from many about our MWP box, and would like to float the idea that we delete the bottom (Osborn and Briffa) panel. I know this is shocking coming from me (I think O&B, 2006 is a paper of the year contender!), but I have become convinced that it will be too much of a lightning rod for what it gives us. We still show the data in the top panel, which conveys the same thing (although in a much less sophisticated way!), and we still back up with citations to O&B2006. BUT, we hopefully avoid a possible intense focus on methodological focus on the fig, and the criticism that it's LA work that hasn't been thoroughly vetted. This focus (i.e., from skeptics and those inclined to listen to them for political reasons) is stupid, but we want to keep readers focused on the science and not on the politically-generated flak. I think we can do this just as well without the O&B06 figure, assuming we still cite the findings of the O&B06 paper, but just don't show the figure. We also save space - not the reason for my suggestion, but a good thing given what Keith and Tim need to add in response to issue like divergence etc.

Obviously, was the biggest fan and pusher for the figure to be included, and I'm sorry to be suggesting otherwise now.

Does this make sense?

Thanks, Peck

Dr. Solomon,

It is not clear what makes the Wegman Committee Report in your opinion a "new low". In scientific study, one part is clearly physical (growth rates of trees, IR absorption, etc.) and a separate part is the statistical treatment of the data.

Dr. Wegman's report is clearly focused on the latter. He is well qualified to analyze statistical methods, as chair of the National Academy of Sciences' (NAS) Committee on Applied and Theoretical Statistics, and a board member of the American Statistical Association.

The conclusion of the Committee headed by Dr. Wegman is clear - the statistical methods of MBH 98/99 cannot be relied upon to support the claim that the 90's were the hottest decade of the past millennium. If one wants to argue with Dr. Wegman's conclusion, it will be necessary to show how he has misunderstood or misrepresented the statistical methods used in those studies.

Obviously this does not prove that the 90's were not the hottest decade of the past millennium, only that the MBH 98/99 analyses cannot be used to support that claim, nothing more and nothing less.

Anyone interested in paleoclimatology in general, and dendrochronology in particular, should read the recent NAS report and the Wegman Committee Report (or in fact anyone interested in the use of statistics in climatology).

Your last comment seems to reflect a belief that it is scurrilous to "question unquestioned science". Wouldn't there seem to be a long honored history of exactly this type of action, both before and after Einstein? Or perhaps I'm misinterpreting your remarks.

Geoff Smith

You also may want to look at a new "report" prepared for Barton by a group of statisticians regarding the hockey stick - this is going to be the focus of the hearing, in order to advertise it. It seems (to me) to be a new low in politics to have a "congressional report" generated specifically to question unquestioned science.

CLIMATE: New House report sets stage for another 'hockey stick' brawl
Lauren Morello, E&ENews PM reporter
Flawed statistics underlie the controversial "hockey stick" climate analysis, according to a report released today by an ad hoc panel of scientists assembled by the House Energy and Commerce Committee.

The report contradicts a recent National Academy of Sciences study that found the hockey stick analysis -- which concluded Earth has been warmer

over the last millennium than at any other point -- is largely correct.

Published in 1998 by the journal Nature, the hockey stick reconstructs past global average temperatures using data from corals, tree rings, ice cores and bore holes deep within the Earth -- the first to draw on multiple sources of "proxy data" to sketch a picture of past climate.

The study includes a graph that shows Earth's average temperature increasing sharply during the 20th century, with an upward curve that resembles the

blade of a hockey stick. Often cited as evidence that human emissions are the dominant cause of rising global temperatures, the graph became controversial after it appeared in a 2001 Intergovernmental Panel on Climate Change report.

But the House Committee's ad hoc panel says the hockey stick's authors relied on statistics that are pre-disposed to produce the hockey-stick shape.

Claims by the hockey stick paper's authors of unprecedented global warming during the 20th century "cannot be supported by [the] analysis," the panel concluded.

The Energy and Commerce Committee -- whose chairman, Rep. Joe Barton (R-Texas), is a leading Capitol Hill critic of the hockey-stick study -- has scheduled a hearing next week on the ad hoc panel's conclusions.

In June 2005, Barton and Oversight and Investigations Subcommittee Chairman Ed Whitfield (R-Ky.) launched a probe into scientific and financial records of climatologists who created the graph -- Michael Mann of Pennsylvania State University, Raymond Bradley of the University of Massachusetts and

Malcolm Hughes of the University of Arizona (Greenwire, July 18, 2005).

That prompted a rare show of public infighting between Barton and Whitfield and House Science Committee Chairman Sherwood Boehlert (R-N.Y.), who asked the National Academy of Sciences to examine the validity of the hockey stick and similar climate reconstructions (Greenwire, June 23).

Attachment Converted: "c:\eudora\attach\EosMeetingReportFinal.doc"

From: Tim Osborn <t.osborn@uea.ac.uk>
To: Jonathan Overpeck <jto@u.arizona.edu>, Keith Briffa <k.briffa@uea.ac.uk>
Subject: new fig 6.14
Date: Mon, 17 Jul 2006 15:08:48 +0100
Cc: Eystein Jansen <eystein.jansen@geo.uib.no>, joos <joos@climate.unibe.ch>

<x-flowed>

Hi Peck, Eystein and Fortunat,

I've drafted two versions of the new fig 6.14, comprising a new panel showing the forcing used in the EMIC runs, plus the old fig 6.13e panel showing the EMIC simulated NH temperatures. Keith has seen them already.

First you should know what I did, so that you (especially Fortunat) can check that what I did was appropriate:

(1) For the volcanic forcing, I simply took the volcanic RF forcing from Fortunat's file and applied the 30-year smoothing before plotting it.

(2) For the solar forcing there are 2 curves. For the first, I took the Bard 0.25% column from Fortunat's RF file. For the second, I took the Bard 0.08% column from Fortunat's RF file from 1001 to 1609, and then appended the WLS RF forcing from 1610 to 1998. Then I smoothed the combined record. NOTE that for the Bard0.25%, the line is flat from 1961 onwards which probably isn't realistic, even though that is what was used in the model runs.

(3) For the "all other forcings" there are 2 curves. For the first, I took the CO2 concentrations provided by Fortunat, then used the "standard" IPCC formula from the TAR (in fact the first of the three options for CO2 in IPCC TAR Table 6.2) to convert this to a radiative forcing. I then added this to the non-CO2 radiative forcings data from Fortunat's file, to get the total radiative forcing. For the second, I replaced all values after 1765 with the 1765 value (for the natural forcings case). Then I smoothed the combined record (as in fig 6.13c, I only applied a 10-year smoothing when plotting the "all other forcings", because it is fairly smooth anyway and using a high smoothing results in lower final values when there is a strong trend at the end of a time series).

Now, some comments on the figures themselves (please print them and refer to them when reading this):

(1) File 'chap6_f6.14_option1.pdf' is strongly preferred by Keith and me. This shows the three forcing components separately, which helps with understanding the individual causes of specific warming and cooling periods. I have managed to reduce the size of this considerably, compared to the equivalent panel in fig 6.13, because with only a few series on it I could squeeze them together more and also reduce the range of the vertical axes.

(2) Although we don't prefer it, I have also made 'chap6_f6.14_option2.pdf' which is even smaller by only showing the sum of all the forcings in the top panel.

Which version do you prefer? Please let me know so I can make final changes only to the preferred version.

Some more comments:

(1) Fig 6.14b was originally Fig 6.13e. When it was part of that figure, the colour bar showing the shades of grey used to depict the overlapping ranges of the published temperature reconstructions was only on Fig 6.13d. Do you think I should now also add it to the EMIC panel (6.14b), now that it is in a separate figure? It will be a bit of a squeeze because of the legend that is already in 6.14b.

(2) Another carry over from when 6.14b was part of 6.13, is that the time range of all panels had to match (900-2010). Now that the EMICs are in a separate figure, I could start them in year 1000, which is when the forcing and simulations begin. Unless you want 6.13 and 6.14 to remain comparable? Again please comment/decide.

(3) I wasn't sure what colours to use for the forcing series. In option 1, the volcanic and other forcings apply to all runs, so I chose black (with thick/thin used to distinguish the "all" forcings from the "natural-only" forcings (basically the thin flat line in "all other forcings)). The cyan-green-blue runs used strong solar forcing, so I used blue for that forcing. The red-orange-brown runs used weak solar forcing, so I used brown for that forcing. Sound ok?

Sorry for the long email, but I wanted to get everything explained to avoid too many iterations.

Please let me know your decisions/comments on these questions, or on

any other aspects of the new figure.

Cheers

Tim

Hi all,
I'm halfway through these changes and will get the revised figures out to you probably tomorrow, except maybe the SH one, because:
I'm not sure if the van Ommen (pers. comm.) data shown by Jones & Mann and suggested by Riccardo are the data to use or not. Is it published properly? I've seen the last 700 years of the Law Dome 18O record published, so perhaps we should show just the period since 1300 AD? That period appears in:
Mayewski PA, Maasch KA, White JWC, et al.
A 700 year record of Southern Hemisphere extratropical climate variability
ANNALS OF GLACIOLOGY 39: 127-132 2004
and
Goodwin ID, van Ommen TD, Curran MAJ, et al.
Mid latitude winter climate variability in the South Indian and southwest Pacific regions since 1300 AD
CLIMATE DYNAMICS 22 (8): 783-794 JUL 2004
See below for some more comments in respect to individual figures.
At 21:36 30/06/2006, Jonathan Overpeck wrote:

Figure 6.10.

1. shade the connection between the top and middle panels

yes

2. remove the dotted (long instrumental) curve from the middle panel

yes

3. replace the red shaded region in the bottom panel with the grey-scale one used in Fig 6.13

yes

4. label only every increment of 10 in the grey-scale bar (formally color) in the bottom panel

yes

5. Increase font sizes for axis numbering and axis labeling - all are too small. You can figure out the best size by reducing figs to likely page size minus margins. We guess the captions need to be bigger by a couple increments at least.

yes

Figure 6.11.

1. This one is in pretty good shape except that Ricardo has to determine if S. African boreholes need to be removed.

I think Henry said they were published and could stay

Figure 6.12

1. again, please delete S. African borehole if Ricardo indicates it's still not published.

I think Henry said they could stay.

2. consider adding Law Dome temperature record - Ricardo is investigating, but perhaps Keith/Tim can help figure out if it's valid to include. Feel free to check with Valerie on this too, as she seems to know these data at least a little

Already discussed above.

3. also, please increase font sizes and make sure they match 6.10 - probably better to use bold fonts

You are right that I've mixed bold and non-bold. When reduced to small size, the non-bold actually read more clearly than the bold, I think, so I'll standardise on non-bold. It's not possible to completely standardise on the size, because each figure I provide might be scaled by different amounts. I don't know final figure size, so will make a good guess. Should be ok.

Figure 6.13

1. we are going to split the existing 6.13 into two figure. The first is 100% Tim's fig., and is just an upgrade of the existing 6.13 a-d, with the only changes being:
1a. delete the old ECHO-G red dashed line curve in panel d, and

Keith says this was discussed and rejected, so I should keep old ECHO-G in?

1b. please also increase font sizes and make sure they match 6.10 and 12 - please use bold fonts.

ok, as discussed above.

2. The existing 6.13e is going to become a new 6.14, with the addition of a new forcings panel "a" on top of the existing panel e (which becomes 6.14b). To make this happen, Tim and Fortunat have to coordinate, as Tim has the forcing data (and knows what we what) and Tim has the existing figure. We suspect it will be easier for Fortunat to give Tim data and layout advice, and for Tim to make a figure that matches the other figs he's doing. PLEASE NOTE that this fig can't be as large as the existing 6.13a-d, but needs to be more compact to permit its inclusion.

done.

Cheers

Tim

Date: Mon, 17 Jul 2006 17:46:01 -0400
Reply-to: ITRDB Dendrochronology Forum <ITRDBFOR@LISTSERV.ARIZONA.EDU>

"Non-independence" of reconstructions and "worthlessness" of the hockey stick model were raised as separate issues.

If the worth of a model is measured by its ability to predict, then a model that explains 0.5% of the variation in some variable is fairly (but not necessarily completely) "worthless". Surely, one hopes for better. Especially where consensus is required.

The proxy data on which multi-proxy reconstructions are based may be statistically independent, but the reconstructions themselves are not. This is not because of any lack of "independence" (i.e. objectivity) among networked researchers, but a measurable fact of arithmetic. To the extent that multi-proxy reconstructions are built on the same proxy data, they are statistically non-independent (i.e. correlated).

i.e. It's not the non-independence that make the model worthless. It's the uncertainty.

On your last point of social networks, try a Google search of 'Exxon Secrets'. The difference between a ruling orthodoxy and a scientific network is not the degree of connectivity, but the mode of governance: coercion & inculcation vs. facts & reason (including statistical inference). Be wary of any science that loathes statistics or resents external investigation. That's the start of rot.

If Wegman et al. are suggesting that statisticians should be put to work to serve the interests of paleoclimatologists (which they are), then who on this list is going to argue that? I say let's put them to work!

Barry Cooke

>Maryanne's message further claims that the "characterization of the
>hockey stick as 'worthless' underscores what appears to be a basic lack

>of understanding of how scientific consensus is formed". Yet if a
>consensus is based on invalid statistical analysis, then the consensus
>is wrong.

To explain my point (and my apologies to those to whom this is obvious):
it would not be unprecedented for a scientific consensus to be wrong.
However, there is also ample precedent for papers containing flaws
(which virtually all do, if somebody looks hard enough, or has the
misfortune of having the resources of Congress devoted to finding them)
to have constructive influence on debate. To take an example from
history, many of Charles Darwin's observations are pure amateurish
nonsense by the standards of even the late 19th century, but no one
would doubt their value in building the consensus for evolution. The
question is not always strict veracity, but whether work provokes
fruitful questions, or leads research in a constructive direction. (By
the way, this is not to take a position on the Wegman judgement on the
MBH papers).

>Dave's message further claims that there are multiple "independent
>lines of evidence" for the hockey stick. The Wegman report discusses
>this claim. See especially p.46-47, which cite twelve different
>studies and concludes that those studies "cannot really claim to be
>independent".

This part of the report is more precious than useful. In most empirical
fields, leading primary investigators have linkages--nothing unusual
about that. We could construct similar matrices of social networks in
physics, biology, statistics. That doesn't mean the works produced in
physics, biology or statistical theory are "worthless". A similar point
can be made about different investigators using the same proxy data. In
fact, isn't it one of the recommendations of the Wegman report that the
paleoclimate community share data more effectively? Seems that if that
recommendation was followed, certain statisticians would have even more
occasion to complain of a lack of true independence. Seems these poor
climate experts can't win!

Wouldn't it be interesting to see a "social network" matrix--or a
funding matrix--between those the scientists, statisticians,

Congressional Republicans, and oil companies most passionate about
"debunking" global climate change?

Hi Tim et al (especially Valerie) - again, sorry for the confusion, but hopefully the emails sent and forwarded from Valerie and me this evening helps figure this out. I think we're going with borehole for Law Dome, but you guys need to confirm it's the way to go. I'm cc'ing to Valerie in the hope she can try to provide more guidance in this - with a confirmation that it's the best way to go and will stand up to criticism. If we have multiple conflicting temp recons from Law Dome, and one can't be shown from the literature as being the best, then we should state that, and show neither - just an idea. BUT, I think Valerie was pretty sure the borehole was best. She should be more available in a day or so.

Thanks all, cheers, Peck

<x-flowed>

Hi all - Thanks for all the Euro-dialog before I even got to my computer - lots of good issues raised, and glad the misunderstanding got cleared up.

Eystein and I can't connect easily today, so I'm going to take a stab at the CLA compromise, guessing that he'll concur. If not, he can clarify.

1) We really do need to see the original forcing (spikes for volc, higher freq for solar), so that should be a given. If Tim can do his usual graphical magic and get a smoothed version in there too, that's ok, but I think Fortunat is correct that this new 6.14 gives us a chance to show data differently (and in a way that the TS team really would like). BUT, to show a smoothed curve, perhaps behind? (or whatever looks best and makes it easy to see the more raw data) the more raw data, would be a nice way to connect 6.14 with 6.13, and also make the points that Tim points out - especially highlighting the obvious link between forcing and response prior to 1900. This last point is key for the TS too. BUT, please don't make the more raw data hard to see - they are a KEY part of this fig, especially in the TS. So... go for it Tim - I suggest some annotation for those peaks that are too large to plot - perhaps an asterisk with a note in the caption that "*volcanic forcing peaks larger than XXX are truncated for plotting purposes" or something like that.

2) the normalisation reference period should be consistent between all of the associated figs, so I'd stick with with you've been doing Tim. Otherwise, it will be too confusing.

3) as to whether forcing should be proportional. As long as the scaling (y-axis labeling) is explicit we can be flexible here in order to make sure viewers can see all of the smoothed and unsmoothed forcing data clearly. That is the key, and we can relax the need to have them all proportional in this fig.

Bottom line is that the forcing data we present should have the ability to see the differences in solar clearly - as Fortunat's mock-up plot does. This is driven more from the TS, but that's ok - we get serious play in the TS.

Hope this provides enough for Tim to go with, and as always, if you want to provide some options, that's fine.

Fortunat - you'll need write the caption - hopefully keeping it as brief as possible by citing the earlier captions in the report.

thanks all! best, Peck

That may be "the point" that you're choosing to focus on. My point, quite apart from yours, is that (1) there were oversights in MBH98, (2) that paper appears to have been rushed to publication, (3) M&M03 appear to have been shunned by the scientific review process, (4) Wegman et al. have got a couple of good points on the statistics of tree-ring calibration worthy of discussion, (5) the issue of calibration error cuts to the core of the debate, as it is what underlies the breadth of the confidence envelope around the hockey stick during the MWP. You criticize their analysis of the MBH98 social network, but what do you make of their more substantive argument regarding errors in calibration response functions?

Barry

Fair enough. But I believe the point (or at least the implication) is being made that these networked researchers are failing to adequately review the work of their peers. It would also be naive not to expect that Mr. Barton and the political wing of the "Climate science is bunk" crowd will use those connects to argue for the "worthlessness" of most everything produced by the network. (Note the recent public comments by

Senator Inhofe).

Hi Tim, Ricardo and friends - your suggestion to leave the figure unchanged makes sense to me. Of course, we need to discuss the Law Dome ambiguity clearly and BRIEFLY in the text, and also in the response to "expert" review comments (sometimes, it is hard to use that term "expert"...).

Ricardo, Tim and Keith - can you take care of this please. Nice resolution, thanks.

best, Peck

<x-flowed>

Hi Keith,

Thanks.

My concerns comes from the following. I am not convinced that one gets the same response when forcing a model with smoothed volcanic forcing instead with the spikes. I suspect that the ocean will gain more heat in the later case due to the longer time to respond to the forcing.

However, this remains to be tested, but nobody has done this as far as I know. In other words, postprocessing the output of a model forced with high resolution data does not necessarily give the same results as forcing the model with smoothed input. There is a chance to get different results. That is why I prefer to show the real forcing, i.e. the volcanic spikes. As long as nobody has done such tests run I would prefer to be scientifically on the save side with the figure. Sorry, but this is my modellers view on this.

Forcings do not need to be on the same scale here. We know that temporarily volcanic forcing, albeit negative, is much larger than anthropogenic forcing. Why should we hide this well-know fact? Sceptics my call on this. Readers of our chapter are hopefully able to interpret the y-axis.

The TS-team (in this case neither me nor Peck) asked us to show the volcanic spikes.

A point of the figure is to show the implication of low solar forcing (WLS versus Bard) that is why I prefer to blow the solar panel somewhat up. We have varied solar forcing between the different runs. Of course the point about the natural forcing only simulation not able to get the 20th century warming is very important. Indeed, I believe that this important conclusion is underscored if we make it very clear that we have varied solar forcing over a wide range (by a factor of 3).

It would also be nice to show the 11-yr solar cycle that is in the data (sun spots, but also 14C).

As far as normalisation of the forcing is concerned. I have no strong opinion. There is a consistency issue with chapter 2 where radiative forcing is always defined relative to 1750 (1750==0). This point may especially be important for the TS. There is also the issue about agreement over recent decades. This is why I slightly prefer to normalize the forcing to be zero around 1750.

The sulfur figure will show volcanic spikes. We have agreed in Bergen that we add a sentence to the caption to point out that sulfate deposition may strongly vary regionally.

I think we have with fig 13 and 14 now the opportunity to convey to the readers the same information in two different ways. Perhaps, we should not miss this opportunity. In any case, we will find a solution and then go forward.

Cheers, Fortunat

<x-flowed>

Hi Henry - excellent feedback, thanks. I think it should be easy for Valerie (Holocene issues in 6.5) and Keith/Tim.Ricardo (last 2k, section 6.6) to deal with the 'expert' review issues regarding this paper. It sounds to me like that is the place for discussion of this paper, rather than in the text itself. BUT, it is important that the responses to review comments be thorough and convincing - Valerie and Keith - please update your responses in this respect.

thanks all, Peck

>

>>Hi again Henry - I've attached an 1997 paper of

>>your's and wonder if you could shed some

>>up-to-date insights on how to best interpret.

>>In particular:

>>

>>1) it has been pointed out to us that the

>>result in this paper argue for a globally warm

>>period during the middle Holocene that was
>>warmer than today. Our assessment (i.e., Figure
>>6.9) indicates that there was likely no period
>>during the Holocene that was warmer around the
>>global than the late 20th century. Especially
>>outside of the tropics, there were periods
>>warmer than today during the Holocene, but
>>these regionally warm periods were not
>>synchronous - at least at the centennial scale
>>we can examine with proxy data. Thus, although
>>Huang et al. 1997, indicates greater mean
>>annual global warmth, it was unlike the
>>synchronous global warming of the late 20th
>>century.

>>
>>Plus, we believe the warmth of the Holocene was
>>driven by orbital forcing, and that what we see
>>makes sense in that regard. Huang et al, 1997
>>can be explained perhaps (this is a question)
>>by the heavy borehole coverage in the Northern
>>mid- to high-latitudes? We also know that proxy
>>data shown in Fig 6.9 also indicate more
>>warming (again, not synchronous) in Southern
>>Hem mid-latitudes - where there are also many
>>boreholes.

>>
>>Obviously, another issue is that the boreholes
>>don't give the same temporal resolution as the
>>other proxy records we synthesized/assessed,
>>and at least in your paper, there isn't
>>regional information either.

>>
>>So - the point is not (unless you suggest
>>otherwise) that Huang et al 97 is wrong, but
>>rather than within the limits of the data, it
>>is compatible with what the higher-resolution,
>>regionally-specific, multi-proxy data are
>>showing in Fig 6.9, and that there was likely
>>no period during the Holocene that was warmer
>>synchronously around the global than the during
>>the late 20th century. Do you agree with this,
>>and is our reasoning accurate and complete?

>>
>>2) Huang et al 1997 also shows evidence for
>>warmth within the last 500-1000 years that was
>>greater than during the 20th century AND a cool
>>minima 200 years ago. Both of these are
>>highlighted in your abstract, and both seem
>>incompatible with other evidence. For example,
>>your own more recent work has shown the coolest
>>temperatures to be about 500 years ago.

>>
>>We didn't think it was within our focus to

>>comment on these issues, but we are being asked
>>to by reviewers, and it would be good to have
>>your help in addressing these issues -
>>hopefully in our responses to review comments
>>rather than in our main text (which has to be
>>shortened).

>>

>>Many thanks for your help with this paper and the issues it raises.

From: Tim Osborn <t.osborn@uea.ac.uk>
To: Jonathan Overpeck <jto@u.arizona.edu>, Keith Briffa <k.briffa@uea.ac.uk>
Subject: new figs 6.11 and 6.12
Date: Wed Jul 19 16:04:00 2006
Cc: Eystein Jansen <eystein.jansen@geo.uib.no>, "Ricardo Villalba" <ricardo@lab.cricyt.edu.ar>, joos <joos@climate.unibe.ch>

Here's the new 6.11 and 6.12. Very few changes necessary.
At 21:36 30/06/2006, Jonathan Overpeck wrote:

Figure 6.11.

1. This one is in pretty good shape except that Ricardo has to determine if S. African boreholes need to be removed.

It turned out that these could stay. All I've done is to add some white latitude/longitude lines.

Figure 6.12

1. again, please delete S. African borehole if Ricardo indicates it's still not published.

Not necessary.

2. consider adding Law Dome temperature record - Ricardo is investigating, but perhaps Keith/Tim can help figure out if it's valid to include. Feel free to check with Valerie on this too, as she seems to know these data at least a little

We decided not to do this, but to discuss in the text instead.

3. also, please increase font sizes and make sure they match 6.10 - probably better to use bold fonts

Fonts are bigger. Decided to standardise on non-bold fonts for all these plots.

Cheers

Tim

Hi Tim - Thanks. If you don't mind, let's see what the new grey in panel c, and also the 5-95% range on a. Also, another alternative to the grey and red could be some other color that is just less bright - perhaps blue?

Agree there is no reason to switch the reviewed panel c uncertainty approach. It argues a bit that we leave panel a as is too. I'm unsure what is best, so maybe see what Keith thinks too - and discuss more with Phil - he is right that most are trying to go with 5-95 where possible.

Thanks again.

I should also say, Caspar, that I've not forwarded any documents to Philip yet with more details about the challenge. I thought that you should do that instead, because you will have (more likely) kept track of where the latest version is.

Cheers

Tim

Hi Caspar,

I forgot to forward to you Philip Brohan's positive response to my invitation for him to be involved in the production of pseudo-proxy and pseudo-instrumental data for the climate reconstruction challenge.

It is copied below and you can find his contact details below too.

Best wishes

Tim

Hi Tim.

Thanks for your notes from the workshop. It sounds both interesting and very positive - I was afraid that the relations between the participants would break down completely, but you've clearly made good progress.

I think a blind test of reconstruction methods is an excellent idea, and I'm happy to support it in any capacity. I've done this before with nuclear fuel performance models, and the results were both alarming and instructive. Doing it properly won't be easy though, I think several different stretches of model simulation will be required.

So yes - volunteer me to Caspar (or the organising committee) to make pseudo-proxy and pseudo-instrumental data.

From: "Wahl, Eugene R" <wahl@alfred.edu>
To: "Keith Briffa" <k.briffa@uea.ac.uk>
Subject: RE: confidential
Date: Fri, 21 Jul 2006 04:23:24 -0400

Hi Keith:

I hope you are well in all this!!

I have done my best this evening to digest the issues you asked me to look at, and to give perspective on them. Here is what I can offer at this point.

1) Thoughts and perspective concerning the reviewer's comments per se. These are coded in blue and are in the "Notes" column between pages 103 and 122 inclusive. It got to the point that I could not be exhaustive, given the very lengthy set of review thoughts, so I am also attaching a review article Caspar and I plan to submit to Climatic Change in the next few days. [The idea is that this would accompany the Wahl-Ammann article, to summarize and amplify on it -- given all the proper and non-proper interpretation WA has received and the need for subsequent analysis that WA only lightly touches on. Steve Schneider is aware that it is coming.] I think a read through this, especially the part on PCs and Bristlecones, can say about all I might offer additionally. It is not lengthy.

Please note that this Ammann-Wahl text is sent strictly confidentially -- it should not be cited or mentioned in any form, and MUST not be transmitted without permission. However, I am more than happy to send it for your use, because it succinctly summarizes what we have found on all the issues that have come up re: MBH. As you can see, we agree at some level with some of the criticisms raised by MM and others, but we do not find that they invalidate MBH in any substantial way.

2) I have added a brief suggested alteration to page 6-3 of the draft text you sent, to take into account the fact Wahl-Ammann decidedly settles the issue concerning how proxy PC calculations impact the MBH style reconstruction. These changes are encoded using WORD's "Track Changes" feature.

I did not get into suggesting how that paragraph might otherwise be rewritten. You can see more generally where Caspar and I have gone in the attached text, and how our work relates generally to the MM, von Storch, etc. "examinations" of MBH. Thinking further, the "Validation Thresholds and Measures of Merit" and "Amplitude Issues" sections might also be well worth a look. The former will help you see how over-strong and one-sided are the arguments Steven McIntyre puts forth in this area. (Cf. Wahl-Ammann Appendix 1 also on this topic -- McIntyre strongly avoids, or simply chastizes as ad hoc, the false negative issues at lower frequencies that we raise concerning the use of r2.) He has done with the IPCC just what he did in reviewing the Wahl-Ammann paper--and indeed in all his efforts--write volumes of very strongly worded, one-sided

critiques, which can take a lot of time to see through and then respond to. I hope what we have written can help you in this way. I note that Mike Mann, Richard Alley, and others have written response comments, which would be useful for getting perspective also.

Finally, note also that I corrected the reference to Wahl, Ritson, Ammann (Wahl et al., 2006) on page 6-6, and put the correct publication information in the reference section.

I hope this all helps. I would be happy to do my best to answer any further questions you might have.

All the best, and Peace, Gene

Gene

I am taking the liberty (confidentially) to send you a copy of the reviewers comments (please keep these to yourself) of the last IPCC draft chapter. I am concerned that I am not as objective as perhaps I should be and would appreciate your take on the comments from number 6-737 onwards, that relate to your reassessment of the Mann et al work. I have to consider whether the current text is fair or whether I should change things in the light of the sceptic comments. In practise this brief version has evolved and there is little scope for additional text, but I must put on record responses to these comments - any confidential help, opinions are appreciated. I have only days now to complete this revision and response.
note that the sub heading 6.6 the last 2000 years

is page 27 line35 on the original (commented) draft.
Cheers
Keith

I suggest only one of us - Fortunat - make these changes in his version , otherwise we are all going to do it slightly differently.

Keith

At 08:16 19/07/2006, Fortunat Joos wrote:

Hi,

What we agreed was actually to keep line 25 to line 34 on p 6-35 and not just until line 30. (As well line 50, p-36 line 2-7).

The sentence on line 32/33 that there is general agreement in the evolution of the different proxies is important as there is in general much confusion about this and this is a chapter 6 statement covering the whole millennium. The sentence also links nicely to the next sentence on line 50. Yes, as agreed in Bergen delete the other parts if chapter 2 indeed is going to cover it. I have not done so in my revision as I wanted to hear what chap 2 is doing before deleting.

Peck, in total we will delete 22 line. Note that I have also squeezed out a few line in the sulfur section. Making progress!

Regards, Fortunat

David Rind wrote:

Jonathan,

Keith and I discussed this at the meeting; basically what we need to keep is:

P. 6-25, lines 25-30, first sentence on line 50, and P. 6-26 the first paragraph (lines 2-7).

All the rest is discussed in one form or another in Chapter 2, pp. 55-56.

Concerning the volcanic forcing, there isn't nearly as much overlap, and Chapter 6 did not have very much anyway - I think it would be useful to keep what's there, adding just a reference to Chapter 2 (add: "see also

Chapter 2", at the end of line 26). (I'm assuming that Fig. 6-13a still includes the solar and volcanic forcing).

David

At 11:40 AM -0600 7/18/06, Jonathan Overpeck wrote:

Hi David - it's good to know you can get to work before someone, even if they live in Europe.

Your plan sounds good, and is it safe to assume that you will be making sure Chap 2 gets the right material from chap 6, and that we can thus pare our discussion of past solar and volcanic forcing down to a minimum? Can you give us an update of what they will not cover that we should (i.e., looking at section 6.6)?

Many thanks, Peck

Hi All,

[It's a sad state of affairs if I'm the one who gets to work sooner! (regardless of the time difference).]

What is discussed below is basically what we thought in response to Gavin's comment - that we would basically cross-reference chap 2, where the primary discussion would occur. It's consistent with chapter 2's general discussion of how forcings have changed over time, and would seem odd if chapter 2 left out past solar and volcanic forcing. Chapter 2 should feel free to utilize anything that existed in Chapter 6 on these issues to complement their discussion, if the need arises. Once that is finalized, Chapter 6 can then make the proper cross-references.

David

At 10:26 AM -0600 7/18/06, Jonathan Overpeck wrote:

Hi Ricardo - good points. We did discuss this in Bergen, and David Rind (as a Chap 2 CA) was going to help make sure we kept things covered in chap 2, while cutting our solar and volcanic discussions in chap 6. The key will be cross-referencing chap 2 carefully. So, Keith, Ricardo and David - please interact to figure out how to work this efficiently. Perhaps David could comment first since he's at work sooner. Thanks... Best, Peck

Hi all!

In comment 6-811, Gavin Schmidt points out that our sections

6.6.3.1 Solar forcing

6.6.3.2 Volcanic forcing

largely replicate the discussion in Chap. 2 on the same topics. I checked Chap. 2, and they provide a large (almost 8 pages in the SOD) discussion mainly on solar and but also on volcanic forcings. Gavin suggests that only the implementation issues should be discussed in our chapter and leave the most general information in Chapter 2. We can substantially short our section following his advice. Please, find below the outline of the sections in Chap. 2 dealing with solar and volcanic forcings. Cheers, Ricardo

2.7 Natural Forcings

2.7.1 Solar Variability

2.7.1.1 Direct observations of solar irradiance

2.7.1.1.1 Satellite measurements of total solar irradiance

2.7.1.1.2 Observed decadal trends and variability

2.7.1.1.3 Measurements of solar spectral irradiance

2.7.1.2 Estimating past solar radiative forcing

2.7.1.2.1 Reconstructions of past variations in solar irradiance

2.7.1.2.2 Implications for solar radiative forcing

2.7.1.3 Indirect effects of solar variability

2.7.2 Explosive Volcanic Activity

2.7.2.1 Radiative effects of volcanic aerosols

2.7.2.2 Thermal, dynamic and chemistry perturbations forced by volcanic aerosols

Subject: Re: Special instructions/timing adjustment

Hi all,

I'm halfway through these changes and will get the revised figures out to you probably tomorrow, except maybe the SH one, because: I'm not sure if the van Ommen (pers. comm.) data shown by Jones & Mann and suggested by Riccardo are the data to use or not. Is it published properly? I've seen the last 700 years of the Law Dome 180 record published, so perhaps we should show just the period since 1300 AD? That period appears in:

Mayewski PA, Maasch KA, White JWC, et al.

A 700 year record of Southern Hemisphere extratropical climate variability
ANNALS OF GLACIOLOGY 39: 127-132 2004

and

Goodwin ID, van Ommen TD, Curran MAJ, et al.

Mid latitude winter climate variability in the South Indian and southwest Pacific regions since 1300 AD

CLIMATE DYNAMICS 22 (8): 783-794 JUL 2004

See below for some more comments in respect to individual figures.

At 21:36 30/06/2006, Jonathan Overpeck wrote:

Already discussed above.

>3. also, please increase font sizes and make sure they match 6.10 -

>probably better to use bold fonts

You are right that I've mixed bold and non-bold. When reduced to

small size, the non-bold actually read more clearly than the bold, I

think, so I'll standardise on non-bold. It's not possible to

completely standardise on the size, because each figure I provide

might be scaled by different amounts. I don't know final figure

size, so will make a good guess. Should be ok.

>Figure 6.13

>

Need Fortunat to check the Gavin simplification (with David) and awaiting comments from Henry - though I have had a go at the relevant ones. Still needs the paragraph on tree rings and I have to incorporate Ricardo's bit. But this gives you a near overview of where we are - the inputting of the very many comment responses nearly there.

Keith

Is any body out there - any chance of call her in next half hour - or at home later 44 1953 8510 - Peck?

Peck and Eystein

OK I am still struggling . I will not be able to get stuff to you til tuesday I reckon - masses of typing and having to re-read and consult with others (Henry will get back to me early next week) on the borehole stuff. Discussing stuff with Eugene Wahl (confidentially) and still need to check corrections and balance text. Tim still working on Figures. We are doing best to get stuff back asap - but if I have to incorporate Ricardo's stuff and put into version by Fortunat , it is getting more complicated. Fortunat should do edits relating to the rationalising of the forcing text (as per Gavin comment - or has he already?) . Best if Oyvind puts the lot together then.

Keith

Hi Fortunat and Keith - thanks for keeping close track of the volcanic and solar forcing aspects of 6.6, including coordination w/ Chap 2. The more you can do at this stage, Keith, the better (i.e., mystery changes), but there will be time to update re: chap 2 later.

Thanks again! Peck

Hi again Tim et al - looks good to me. Obviously, you and Keith need to nail the divergence issue in the text, and also refer to it in the caption for this fig, but otherwise, it's looking good.

Thanks, Peck

Hi Peck et al.,

I've increased the axis labelling font size by another pt in all plots.

I attach two versions of 6.10, one in the grey (same as before except for bigger axis labelling) and one in brown. Brown looks like some old curry stain (or worse!). Note that conversion from postscript to PDF or GIF tends to alter the colours, which alter again on different printers compared with the screen. So there's not much point in me playing around much more with the colours.

Also attached are new versions of 6.13 and 6.14. Both have the bigger axis fonts and the matching grey shading as 6.10.

6.13 has thicker lines for all models, so they show up better on the new darker grey shading.

6.14 now has the EMIC forcing shown without any smoothing. I have used a vertical scale for the volcanoes which is half that of the solar and anthropogenic forcings. Only one spike (1258) hits the bottom of the plot with this choice of scaling, and only a couple overlap the solar forcing lines. What do you think now (Fortunat too)? Oh, and I also start now at 1000 rather than 900 AD.

Cheers

Tim

At 17:06 22/07/2006, Jonathan Overpeck wrote:

Hi Tim - this looks pretty nice, and I appreciate your chugging through to make the switch to 5-95%. I'd still be keen to see what the fig looks like in some more modest color than the old red. Grey could be the final choice, but it's not too much of a hassle, could you try a color version that is a bit more sharp?

Also, it would be nice to make the x-axis labels (numbers and "Year") as large as makes sense - they still seem too small.

Sorry to be nitpicky, but this figure is going to be a major one of the whole report, so it makes sense to get it as perfect as we can.

Thanks! best, peck

Hi Peck and Eystein,

what do you think of the attached new version of 6.10? Keith and I have spent some time examining various options and think that this one looks clearer (less smudgy) while still being a good representation of the data and in grey.

I spoke with Phil and Keith and the 5-95% range seems preferable for consistency with other chapters.

So:

(1) I now use 5-95% range in panel (a).

(2) Panel (b) has no further changes to it.

(3) Panel (c) is now also based on the overlap of the 5-95% ranges of the individual reconstructions, rather than on the ± 2 standard error ranges (extra weight is still given for temperatures that fall within the ± 1 SE range). I also applied some week smoothing prior to plotting. I also now plot using just 10 grey shades, in 10% steps, rather than the 20 shades in 5% steps that I used previously (in the last version, I changed the scale bar to have 10 steps of 10%, but I had still plotted the data using 20

steps of 5%).

Hope you like it,

Tim

At 17:33 20/07/2006, Jonathan Overpeck wrote:

Hi Tim - Thanks. If you don't mind, let's see what the new grey in panel c, and also the 5-95% range on a. Also, another alternative to the grey and red could be some other color that is just less bright - perhaps blue?

Agree there is no reason to switch the reviewed panel c uncertainty approach. It argues a bit that we leave panel a as is too. I'm unsure what is best, so maybe see what Keith thinks too - and discuss more with Phil - he is right that most are trying to go with 5-95 where possible.

Thanks again.

Hi again,

I still have the red option built into the program, so can easily revert to it. Of course the grey has the advantage of consistency with the model and EMIC panels, which really must be grey so that all the coloured lines indicating the simulated temperatures will show up (red isn't really an option for the reconstruction shading in those figures). I'll see if I can make it clearer yet keep it in grey.

On a different note, Phil Jones just popped in and said why are we using "+-2SE" shading in the top instrumental panel when it has apparently been decided to show the smaller 5-95% range (he says this is only 0.8225 times the +-2SE range) in all IPCC WG1 figures. Shall I change this? If I do, then the brown and orange curves will fall outside this narrower range more often than they fall outside the current wider SE range.

The grey shading in panel (c) is also computed from the overlap of the +-1 SE and +-2 SE ranges of individual reconstructions, but I guess this can stay unchanged, rather than needing to be recalculated using the overlap of the +-?% and 5-95% ranges?

Cheers

Tim

At 16:05 19/07/2006, Jonathan Overpeck wrote:

Hi Tim - thanks! Now I can see why you went with the red rather than grey in the bottom panel - it's hard to see. I'd like to float the idea with everyone on the email that we consider going back to red, or try something else. All else is good (thanks) perhaps make the bottom/top axis labels bigger still? (both numbers and "Year").

Thx again, Peck

Hi Peck et al.,

revised fig 6.10 is attached.

At 21:36 30/06/2006, Jonathan Overpeck wrote:

Figure 6.10.

1. shade the connection between the top and middle panels

It was already shaded. Your poor old eyes must be failing you ;-)

Ok, so it **was** rather pale! I've made it a bit darker.

2. remove the dotted (long instrumental) curve from the middle panel

Done

3. replace the red shaded region in the bottom panel with the grey-scale one used in Fig 6.13

Done - how does it look now? I had to outline the instrumental series with a narrow white band to ensure it could be seen against the very dark grey shading.

4. label only every increment of 10 in the grey-scale bar (formally color) in the bottom panel

Done

5. Increase font sizes for axis numbering and axis labeling - all are too small. You can figure out the best size by reducing figs to likely page size minus margins. We guess the captions need to be bigger by a couple increments at least.

Increased the axis numbering/labelling by a couple of points.

Cheers

Tim

Cc: Eystein Jansen <eystein.jansen@geo.uib.no>, Keith Briffa <k.briffa@uea.ac.uk>

<x-flowed>

Hi again,

attached is the new MWP box figure.

We reverted back to the figure used in the FOD because the decision to drop the panel from Osborn & Briffa (2006) meant that we were able to show a different selection of curves in the remaining panel from those we used in our paper. This allowed us to drop the shorter series that didn't span the medieval period, simplifying the figure and also dealing with a number of review comments that had been made about those series.

The only differences from the FOD figure are that the font is now consistent with the others figures, the composite mean series has been removed, and the figure has been shrunk vertically to save space.

Cheers

Tim

Guys

here is what I understand you want from me - revised text (only up Table of Key etc) - ie not touched refs (understand Oyvind will put them in - most are given in text)

Tim sending Table and Figure captions separately. I am sending the text with my, Fortunat's and Ricardo's changes - with minor edits of mine added to them.

I undersatand that Oyvind will sort this ou and insert in final Chapter. I am also sendoing my reponses to data to most of my comments (Findicates that Fortunat has answered that one) . I will also send my edited version of Ricardo's reponses that I tweeked - ignore if wish) . I know I have not done all comments yet but the remaining ones can be done tomorrow I hope and any changes needed put on next draft. I do not expect many - and I was not clearwhether Peck wanted to respond to the regional (US) precip related ones anyway? I have added in the rather large paragraph on the tree-ring issues in response to several comments - I know you will scream at the size but I think we need to pu it in and then get Ricardo's

Hi Keith - in our TS/SPM discussions, Susan has raised this question:

"In the TAR they spoke of 1998 being the warmest year in the millennium and the 1990s the warmest decade. I don't see that chapter 6 addresses any of these time scales. I am not saying you should do so - but are you planning to say anything about it and why you aren't doing so? and if you're not planning to say anything at all, can you please tell me what you think about it, just for my own info?"

Would you please give me your feedback on this, with enough thoughtful detail to hopefully make me/Susan fully informed (a para should be enough).

Thanks, Peck

<x-flowed>

Hi Olga,

I agree with Valerie that the ice core evidence is ambiguous. I would personally place more weight on the alkenone data, which is a reasonable well calibrated SST proxy. Foraminifer transfer function based SSTs and some Mg/Ca results that are available suggest a similar picture as far as I know. Of course it is possible and plausible that the tropical oceans are behaving in a non consistent manner and not all areas are showing the same signal, but a sizeable portion appear to do so in order to conclude as we do in the chapter in my opinion. Some signals may be due to changes in in trade wind induced coastal upwelling strength, but there are enough cores with alkenone data outside of these areas. If we were to say more about the uncertainties it may be the fact that proxies are seasonally skewed.

My conclusion is to let the chapter say what we say at the moment.

Cheers,
Eystein

Subject: latest figures, captions and tables from Keith/Tim
Date: Mon Jul 31 14:31:24 2006

Dear all,

we have now updated the figure captions for our section and these are attached as a PDF together with the figures. Unfortunately I forgot to highlight the caption changes in blue... can you just completely replace the old captions with the new ones? We worked hard to make the captions as short as possible, while retaining their accuracy.

When updating the captions, we spotted minor inconsistencies in the labelling of figures 6.10 and 6.12 and so we have corrected these figures and new versions are incorporated in the attachment. The labelling change also affects table 6.1. I have attached the tables again too, with the new change highlighted in red (simply change 'CED2004' to 'ECS2002' in Table 6.1).

Hope this is all ok and now finalised.

If you want me to send the new figures as individual files (EPS format) then please say. Also if you want the new captions/figures as Word rather than PDF, please say (the Word file is large and very slow to open on my PC).

Cheers

Tim & Keith

Subject: Re: Urgent Re: latest version of my responses

Date: Tue Aug 1 15:48:34 2006

Cc: Tim Osborn <t.osborn@uea.ac.uk>, jto@u.arizona.edu, Fortunat Joos <joos@climate.unibe.ch>, Valerie.Masson@cea.fr, Ricardo Villalba <ricardo@lab.cricyt.edu.ar>

Dear all

attached is my latest (currently definitive) version of the responses to the "sky-blue-highlighted" comments on text and Figures.

PLEASE NOTE THAT THESE HAVE CHANGED IN VARIOUS PLACES FROM WHAT I SENT EARLIER AS WELL AS BEING UPDATED. I would suggest that they be cut and pasted into the document rather than just including the new ones. Sorry , but I had to reconsider a number of responses and edit others to remove typos etc.

Even though marked in blue - a few were not relevant to me. Two have been marked with "Valerie " - (6-1072, 6-1073) . Those marked PECK (6-862 through 6-868; ie 7 comments) are best dealt with by he. The comment 6-1110 is for Stefan. The comments marked F are those I sent from Fortunat before and I also sent the edited version of Ricardo's. The two outstanding ones he marked for me/Tim are here (6-818 and 6-819)

6-818 Noted - this issue will be reviewed , though the discussion of forcings must come before that of comparison of simulation results.

6-819 Noted - the text is intended to provide examples only and will be modified to refer to Table 6.2 , where details of all simulations used are provided.

I think that should be OK as far as my stuff goes. I will send minor changes to text (separate message) that have arisen in dealing with final comments.

Cheers

Keith

At 10:37 01/08/2006, Eystein Jansen wrote:

Hi Keith,

could you send me responses to the reviewers's comments received on the figures for 6.6?

The Batch i received only had responses for the comments to the main text. This relates to comment 1074 and onwards. Only quite few comments.

We need to send the comments responses file to the TSU by the week-end so this is urgent. Hope you have time..

Cheers,

Eystein

<x-flowed>

Dear Martin and all others,

Having read the new manuscript, I would like to draw the attention of all of you to the section about McIntyre&McKittrick vs Mann et al. I am not entirely happy with this section. It may be that I am not fully updated about all details on their dispute, but it appears to be some mistakes in this section of our manuscript. Therefore, I ask all of you to check how this section can be improved and clarified. This is very important! If we refer incorrectly to the MM-Mann dispute, I am convinced that all of us will be involved in lengthy frustrating e-mail discussions later on. I anticipate this from personal experience! Let's do our best to avoid this.

The problematic bit of text starts on p. 16, para 4: ("The failure of MM2003 ... is partly due to a misunderstanding of the stepwise reconstruction method") and slightly below: ("MM2003 only calculate principal components for the period when all chronologies are present").

I read through the MM2003 paper yesterday. From what is written there, on p. 763-765, it appears that they were well aware of the stepwise method. On p. 763, about at the middle of the page, they write: "Following the description of MBH98 ... our construction is done piecewise for each of the periods listed in Table 8, using the roster of proxies available through the period and the selection of TPCs for each period listed in Table 8".

This is clearly at odds to what is written in our manuscript. Has it been documented somewhere else that MM2003, despite what they wrote, really misunderstood the stepwise technique? If it is so, we need to insert a reference. If this is not the case, we need to omit the lines about the misunderstanding. We also need to explain better why the MM2003 calculations differ from MBH.

Moreover, our sentence ("MM2003 only calculate principal components for the period when all chronologies are present") imply that MM2003 only calculated PCs for the period 1820-1971, as this would be the period when all chronologies are present according to the MM2003 Table 8. Obviously, they calculated PCs beyond 1820, as their calculations actually extend back to 1400.

The problem continues in the legend to our Fig. 2. (" Each of the 212 data series is shown ... The red rectangle indicates the single block used by MM2003, neglecting all data prior to 1619"). The last sentence is inconsistent with the information in MM2003 in three ways; a) MM2003 clearly show in their Table 8 that they analysed the same blocks of data as MBH. b) The year 1619 as a starting point of a data block is inconsistent with MM Table 8. Where does the year 1619 come from? It is not mentioned anywhere in MM2003. c). The red block implies that MM2003 made calculations back only to 1619, but they did back to 1400.

Moreover, the numbers given in the graph of our Fig. 2 indicate that the total number of series is 211, whereas the text in the legend and also in the main text on p. 16 says 212. Which number is correct?

I suppose that some of you others will know this subject much better than I. I have just read the MM2003 paper, and find our reference to it

to be inconsistent with it. I hope you all can make efforts to make this bit crystal clear. If not, I fear we will get problems!

Finally, I would like to draw your attention to the related sentence in our conclusions on p. 26: ("Papers which claim to refute ... have been reviewed and found to contain serious flaws"). Are all of you happy with this statement? Would it sound better with a somewhat less offending sentence, something like:

"Papers which claim to refute ... have been reviewed and found to essentially contribute with insignificant information that does not affect the consensus, and even to include some flaws."

I attach the MM2003 paper.

I will send some comments to the other parts of the text in a separate mail.

Cheers,
Anders

> relationship which are discussed further in Sect.~2.6 below).
>
> MJ2003 include some additional proxy series and extend to study period back a
> further millennium and conclude that the late 20th century warmth
> is unprecedented in the last two millennia.
>
> \subsection{Climate field reconstruction}
>
> \cite{mann_etal1999} published
> the first reconstruction of the last thousand years northern hemispheric mean
> temperature which included objective error bars,
> based on the analysis of the residuals in the calibration period.
> The authors concluded not only
> that their estimate of the temperature over the whole period 1000AD to 1860AD
> was colder than the late twentieth century, but also that 95% certainty limits
> were below the last decade of the twentieth century.
> The methods they used were presented in MBH1998
> which described a reconstruction back to 1400AD.
>
> MBH1998 use a collection of 415 proxy time indicators, many more than used in \cite{jones_etal1998},
> but many of these are too close geographically to be considered
> as independent, so they are combined into a smaller number of representative
> series.
> The number of proxies also decreases significantly with age:
> only 22 independent proxies extend back to 1400AD,
> and, in
> MBH1999, 12 extend back to 1000AD (7 in the Northern Hemisphere).
> MBH1998 and MBH1999 have been the subject of much debate since the latter was cited
> in the IPCC (2001) report, though the IPCC
> conclusions\footnote{\cite{IPCC2001} concluded that
> ``The 1990s are likely to have been the warmest decade of the millennium in
> the Northern Hemisphere, and 1998 is likely to have been the warmest
> year," where ``likely" implies a greater than 66% probability.
> Since 2001 it has been recognised that there is a need to explicitly
> distinguish between an expression of confidence, as made by the IPCC in this quote,
> which should include expert assessment of the robustness of statistical methods
> employed, and simple citation of the results of statistical test.
> In the language of
> \cite{manning_etal2004} we can say that MBH1999 carried out statistical
> tests which concluded that the 1990s have been the warmest decade of the
> millenium with 95% likelihood, while IPCC (2001), after assessing all
> available evidence had a 66% confidence in the same statement.}
> were weaker than those of MBH1999.
>
> This work also differ from Jones et al. (1998) in using spatial patterns of temperature
> variability rather than hemispheric mean temperatures. In this way the study aims
> to exploit proxies which are related to temperature indirectly: for
> instance, changes in temperature may be associated with changes in
> wind and rainfall which might affect proxies more strongly than
> temperature. Since wind and rainfall are correlated with
> changes in temperature patterns, it is argued, there may be important non-local
> correlations between proxies and temperature.
>
> Different modes of atmospheric variability are evaluated through an
> Empirical Orthogonal Function [EOF] analysis of the time period 1902 to 1980,
> expressing the global field as a sum of spatial patterns (the EOFs) multiplied by
> Principal Components (PCs -- representing the temporal evolution).
> Earlier instrumental data are too sparse to be used for this purpose:
> instead they are used in a validation calculation to determine how
> many EOFs should be included in the reconstruction.
> Time series for each mode of variability are then reconstructed from the proxy data using
> a optimal least squares inverse regression.
>
> Finally, the skill of the regression of each PC is tested using the

> 1856 to 1901 validation data.
> Prior to 1450AD it is determined that only
> one PC can be reconstructed with
> any accuracy. This means that the main advantage of the
> Climate Field Reconstruction method does not apply at earlier dates.
> The methodology will be discussed further in Sect.~3 below.
>
> The reconstructed temperature evolution (Fig.~1) is rather less variable than that of Jones et al. (1998),
> but the differences are not statistically significant.
> The overall picture is of gradual cooling until the mid 19th century,
> followed by rapid warming matching that evaluated by the earlier work.
>
> \subsection{Borehole temperatures}
>
> \cite{huang_etal2000} [HPS2000] estimate northern hemisphere temperatures
> back to 1500AD using
> measurements made in 453 boreholes (their paper also presents global and
> southern hemisphere results using an additional 163 southern hemisphere boreholes).
> The reconstruction is included here, even though it does not extend back to 1000AD,
> because it has the advantage of being completely
> independent of the other reconstructions shown.
> Temperature fluctuations at the surface propagate slowly downwards, so that measurements
> made in the boreholes at depth contain a record of past surface temperature fluctuations.
> HPS2000 used measurements down to around 300m.
> The diffuse nature of the temperature anomaly means that short time scale fluctuations
> cannot be resolved. Prior to the 20th century, the typical resolution is about 100 years.
>
> \cite{mann_etal2003} analyse the impact of changes in land use and snow cover
> on borehole temperature reconstructions and conclude that
> it results in significant errors.
> This conclusions has been refuted by
> \cite{pollack_smerdon2004} (on statistical grounds), \cite{gonzalez-rouco_etal2003}
> (using climate simulations) and \cite{huang2004} (using an expanded network of 696
> boreholes in the northern hemisphere).
>
> \subsection{Medieval Warm Period}
>
> Despite much discussion
> \cite[e.g.]{}{hughes_diaz1994, bradley_etal2003}, there is no clear quantitative
> understanding of what is meant by the ``Medieval Warm Period" [MWP].
> \cite{crowley_lowery2000}
> [CL2000] discuss the evidence for a global MWP, which they interpret as
> a period of unusual warmth in the 11th century. All the reconstructions
> of the 11th century temperature shown
> in Fig.~1 estimate that century to have been warmer than most of the
> past millennium. However, the question of practical importance is not
> whether it was warmer than the 12th to 19th centuries, which is
> generally accepted, but whether it was a period of comparable
> warmth to the late 20th century. MBH1999 concluded, with 95\% confidence, that
> this was not so. CL2000 revisit the question
> using 15 proxy records, of which 9 were not used in the studies
> described above. Several of the series used have extremely low temporal resolution.
> %%CL2000 sought to select tree ring chronologies with consistent quality
> %%throughout their length, as measured by the "sample replication"
> %%\cite{cook_etal2004}.
> %%[check usage of "sample replication" -- cook etal (QSR) is available from Jan's website]]
>
> They draw attention to the spatial localization of the MWP in their proxy series:
> it is strong in North America, North Atlantic and Western Europe, but not
> clearly present elsewhere. Periods of unusual warmth
> do occur in other regions, but these are short and asynchronous.
>
> Their estimate of northern hemispheric temperature over the past millennium is consistent
> with the works discussed above. They conclude that the occurrence of decades of

> temperatures similar to those of the late 20th century cannot be unequivocally ruled
> out, but that there is, on the other hand, no evidence to support the claims
> that such an extended period of large-scale warmth occurred.
>
> \cite{soon_baliunas2003} carry out an analysis of local climate reconstructions.
> They evaluate the number of such reconstructions which show (a) a sustained ``climate
> anomaly" during 800-1300AD, (b) a sustained ``climate
> anomaly" during 1300-1900AD and (c)
> their most anomalous 50 year period in the 20th century.
> Their definition of a ``sustained climate anomaly" is 50 years of warmth,
> wetness or dryness for (a) and (c) and 50 years of coolness, wetness
> or dryness in (b).
> It should be noted that they do not carry out evaluations which allow direct comparison between
> the 20th century and earlier times:
> they compare the number of extremes occurring in the 20th century with the
> number of anomalies occurring in periods of 3 and 4 centuries in the past.
> Both the use of sampling periods of differing length and different selection criteria make interpretation
> of their results problematic.
> They have also been criticised for interpreting
> regional extremes which occur at distinct times as being indicative of a global
> climate extremes \cite{jones_mann2004}. This issue is discussed further in
> Sect.~2.9 below.
> \cite{osborn_briffa2006} perform a systematic analysis along the lines of \cite{soon_baliunas2003}
> and conclude that the proxy records alone, by-passing the problem of proxy calibration
> against instrumental temperatures, show an unprecedented anomaly in the 20th century.
>
> \subsection{Segment length curse}
>
> \cite{briffa_etal2001} and \cite{briffa_etal2002} discuss the impact of
> the ``segment length curse" \cite{cook_etal1995a, briffa_etal1996, briffa2000} on
> temperature reconstructions from tree rings.
> Tree rings have been shown to have much greater sensitivity
> than other proxies on short timescales (JBB1998), but there is a concern that this may not
> be true on longer timescales. Tree ring chronologies are often made up of
> composites of many trees of different ages at one site.
> The width of the annual growth ring
> depends not only on environmental factors but also on the age of the
> tree. The age dependency on growth is often removed by subtracting
> a growth curve from the tree ring data for each tree. This process,
> done empirically, will not only remove age related trends but also any environmental
> trends which span the entire life of the tree.
> \cite{briffa_etal2001} use a more sophisticated method
> (Age Band Decomposition [ABD], which
> forms separate chronologies from tree rings in different age bands,
> and then averages all the age-band chronologies)
> to construct northern hemisphere
> temperatures back to 1400AD, and show that
> a greater degree of long term variability is preserved.
> The reconstruction lies between those
> of MBH1999 and JBB1998, showing the cold 17th century of the former,
> but the relatively mild 19th century of the latter.
>
> The potential impact of the segment length limitations is analysed further
> by \cite{esper_etal2002b, esper_etal2003}, using `Regional Curve Standardisation' (RCS)
> \cite{briffa_etal1992}.
> In RCS composite growth curves (different curves reflecting
> different categories of growth behaviour) are obtained from all the trees
> in a region and this, rather than a fitted curve, is subtracted
> from each individual series. Whereas ABD circumvents the need to
> subtract a growth curve, RCS seeks to evaluate a growth curve which
> is not contaminated by climate signals.
> The ECS2002 analysis agrees well with that of MBH1999 on short
> time scales, but has greater centennial variability \cite{esper_etal2004}.
> ECS2002 suggest that this may be partly due to the lack of tropical proxies
> in their work, which they suggest should be regarded as an extratropical

> Northern Hemisphere estimate. The extratropics are known to have
> greater variability than the tropics.
> % [check]:from eduardo:: Table 1 in MBH GRL 99 --add ref??
> However, it has to be also noted that among the proxies used by MBH1999
> (12 in total), just 2 of them are located in the tropics, both at one location
> (see table 1 below).
>
> \cite{cook_etal2004} study the data used by ECS2002 and pay particular attention
> to potential loss of quality in the earlier parts of tree-ring chronologies
> when a relatively small number of tree samples are available. Their analysis
> suggests that tree ring chronologies prior to 1200AD should be treated with
> caution.
>
> \subsection{Separating timescales}
>
> \cite{moberg_etal2005} follow BOS2001 and ECS2002 in trying to address
> the ``segment length curse'', but rather than trying to improve the
> tree-ring chronologies by improving the standardizations,
> they discard low frequency component of the tree-ring data,
> and replace this with low-frequency information from proxies with lower temporal resolution.
> A wavelet analysis is used to filter different temporal scales.
>
> Each individual proxy series is first scaled to unit variance and then wavelet transformed.
> Averaging of the wavelet transforms is made separately for tree ring data
> and the low-resolution data.
> The average wavelet transform of tree-ring data for timescales less than 80
> years is combined with the averaged wavelet transform of the low-resolution data for
> timescales longer than 80 years to form one single wavelet transform covering all timescales.
> This composite wavelet transform is inverted to create a dimensionless temperature
> reconstruction, which is calibrated against the instrumental record of
> northern hemisphere mean temperatures, AD 1856-1979, using a variance matching method.
>
> Unfortunately, the calibration period is too short to independently calibrate the
> low frequency component. The variance matching represents a form of cross-calibration.
> In all calibrations against instrumental data, the long period (multi-centennial)
> response is determined by a calibration which is dominated by
> sub-centennial variance. The MSH2005 approach makes this explicit and
> shows a level of centennial variability which is much larger than in
> MBH1999 reconstruction and
> similar to that in simulations of the past millennium with two
> different climate models, ECHO-G \cite{storch_etal2004} and NCAR CSM
> ("Climate System Model") \cite{mann_etal2005}.
>
> \subsection{Glacial advance and retreat}
>
> \cite{oerlemans2005} provides another independent estimate of the global mean temperature
> over the last 460 years from an analysis of glacial advance and retreat.
> As with the bore hole based estimate of HPS2000, this work uses a
> physically based model rather than an empirical calibration.
> The resulting curve lies within the
> range spanned by the high-resolution proxies, roughly midway between
> the MBH1999 Climate Field Reconstruction and the HPS2000 bore hole estimate.
>
> Unlike the borehole estimate, but consistent with most other works presented
> here, this analysis shows a cooling trend prior to 1850, related to glacial
> advances over that period.
> It should be noted that
> the technique used to generate the bore hole estimate \cite{pollack_etal1998}
> assumes a constant temperature prior to 1500AD. The
> absence of a cooling trend after this date may be influenced by this
> boundary condition.
>
> \subsection{Regression techniques}
>

> Many of the reconstructions listed above depend on empirical relationships
> between proxy records and temperature. \cite{storch_etal2004} suggest
> that the regression technique used by MBH1999
> under-represents\footnote{This is sometimes referred to as ``underestimating",
> which will mean the same thing to many people, but something slightly different
> to statisticians. Any statistical model (that is, a set of assumptions about the
> noise characteristics of the data being examined) will deliver estimates of
> an expected value and variability. The variability of the expected value is
> not generally the same as the expected value of the variability.)
> the variability of past climate.
> This conclusion is drawn after a applying a method similar to that of MBH1999 to output from a
> climate model using a set of pseudo-proxies: time series generated from
> the model output and degraded with noise which is intended to match the noise
> characteristics of actual proxies.
> \cite{mann_etal2005} use the same approach and arrive at a different conclusion:
> namely, that their regression technique is sound.
> \cite{mann_etal2005} show several implementations of their
> Climate Field Reconstruction Method in the CSM simulation, using different levels
> of white noise in their synthetic pseudo proxies.
> For a case of pseudo-proxies with a realistic signal-to-noise ratio of 0.5, they use
> a calibration period (1856-1980) which is longer than that
> used in MBH1998 and MBH1999 (1901-1980).
> It turns out that the difference in the length of the calibration period is critical
> for the skill of the method (Zorita, personal communication et al., submitted).
> % (I think you can refer to Buerger et al 2006 here. Check with Eduardo if this is OK.
> % By the way, update the reference list: Tellus, 58A, 227-235) [AM]
>
> There is some uncertainty about the true nature of noise on the proxies, and
> on the instrumental record, as will be discussed further below.
> The optimal least squares estimation technique of MBH1998 effectively
> neglects the uncertainties in the proxy data relative to uncertainties
> in the temperature.
> Instead,
> \cite{hegerl_etal2006+} use total least squares regression \cite{allen_stott2003, adcock1878}.
> This approach
> allows the partitioning of noise between instrumental temperatures
> and proxy records to be estimated, on the assumption that the instrumental
> noise is known. \cite{hegerl_etal2006+} show that this approach leads to greater variability in the reconstruction.
>
> \cite{rutherford_etal2005} take a different view. They compare reconstructions
> from 1400AD to present using a regularised expectation maximisation technique \cite{schneider2001}
> and the MBH1998 climate field reconstruction method and find only minor differences.
> Standard regression techniques assume that we have a calibration period, in which
> both sets of variables are measured, and a reconstruction (or prediction) period
> in which one variable is estimated, by regression, from the other.
> The climate reconstruction problem is more complex:
> there are hundreds of instrumental records
> which are all of different lengths, and similar numbers of proxy records,
> also of varying length. The expectation maximisation technique
> \cite{little_rubin1987}
> is well suited to deal with this: instead of imposing an
> artificial separation between a calibration period and a reconstruction
> period, it fills in the gaps in a way which exploits all data present.
> Regularised expectation maximisation is a generalisation
> developed by \cite{schneider2001} to deal with ill posed problems.
> Nevertheless, there is still a simple regression equation at the heart of the technique.
> That used by \cite{rutherford_etal2005} is similar to that used by
> %new: corrected
> MBH1998, so the issue raised by \cite{hegerl_etal2006+} is unanswered.
>
> \subsection{Natural variability and forcings}
>
> Global temperature can fluctuate through internally generated variability of
> the climate system (as in the El Ni\~no phenomenon), through
> variability in natural forcings (solar insolation, volcanic aerosols,

> natural changes to greenhouse gas concentrations) and human changes.
> Reconstructions of variations in the external forcings for the last
> millenium have been
> put forward \citep{crowley2000}, although recent studies have
> suggested a lower amplitude
> of low-frequency solar forcing \citep{lean_etal2002, foukal_etal2004}.
>
> Analysis of reconstructed temperatures of MBH1999 and CL2000 and
> simulated temperatures using reconstructed solar and volcanic forcings
> shows that changes in the forcings can explain the reconstructed long
> term cooling through most of the millenium
> and the warming in the late 19th century \citep{crowley2000}.
> The relatively cool climate in the second half of the 19th century may be
> attributable to cooling from deforestation \citep{bauer_etal2003}.
> \citet{hegerl_etal2003} analyse the correlations between four
> reconstructions (MBH1999, BOS2001, ECS2002, and a modified version of
> CL2000)
> and estimated forcings \citep{crowley2000}.
> They find that that natural forcing, particularly by
> volcanism, explains a substantial fraction of decadal variance.
> Greenhouse gas forcing is detectable
> with high significance levels in all analyzed reconstructions except
> MSH2005, which ends in 1925.
> \citet{weber2005b} carries out a similar analysis with a wider range
> of reconstructions. It is shown that the regression of reconstructed
> global temperatures on the forcings has a similar dependence on timescale
> as regressions derived from the climate model. The role of solar forcing is
> found to be larger for longer timescales, whereas volcanic forcing dominates
> for decadal timescales.
> The trend component over the period 1000 to 1850 is, however, in all
> reconstructions larger than the trend implied by the forcings.
>
> The methods employed by
> \citet{hegerl_etal2006+} attribute about a third of the early 20th
> century warming, sometimes
> more, in high-variance reconstructions to greenhouse gas forcing.
> These results indicate that enhanced variability in the past does not
> make it more difficult to detect greenhouse warming, since a large
> fraction of the variability can be attributed to external forcing.
> Quantifying the influence of external forcing on the proxy records is
> therefore more relevant to understanding climate variability and its
> causes than determining if past periods were possibly as warm as the
> 20th century.
>
> \citet{goosse_etal2005} investigate the role of internal variability using
> an ensemble of 25 climate model simulations of the last millennium
> and forcing estimates from \citet{crowley2000}.
> They conclude that internal variability dominates local and regional
> scale temperature anomalies, implying that most of the variations
> experienced by a region such as Europe over the last millennium could
> be caused by internal variability. On the hemispheric and global scale,
> however, the forcing dominates.
> This agrees with results from a long
> solar-forced model simulation by \citet{weber_etal2004}.
> %% similar This reinforces similar statements made by JOS1998. [where does this come from?]
> \citet{goosse_etal2005}
> make the new point, that noise can lead to regional temperature anomalies
> peaking at different times to the forcing, so that disagreements in
> timing between proxy series should not necessarily be interpreted as
> meaning there is no common forcing.
>
> \subsection{The long view}
>
> The past sections have drawn attention to the problems of calibrating

> temperature reconstructions using a relatively short
> period over which instrumental records are available.
> For longer reconstructions, with lower temporal resolution,
> other methods are available. Pollen
> reconstructions of climate match the ecosystem types with those
> currently occurring at different latitudes. The changes in
> ecosystem can then be mapped to the temperatures at which
> they now occur \citep[e.g.][]{}{bernabo1981, gajewski1988}.
> These reconstructions cannot resolve decadal variability,
> but they provide an independent estimate of local low-frequency
> temperature variations. The results of \cite{weber_etal2004}
> and
> \cite{goosse_etal2005} suggest that such estimates
> centennial mean temperatures can provide some information about
> global mean anomalies, as they strongly reflect the external forcings on
> centennial and longer timescales. However, there has, as yet,
> been no detailed intercomparison between the pollen based
> reconstructions and the higher resolution reconstructions.
>
>
> \section{Critics of the IPCC consensus on millennial temperatures}
>
> The temperature reconstructions described in the previous section
> represent (including their respective differences and similarities)
> the scientific consensus, based on objective analysis
> of proxy data sources which are sensitive to temperature.
> Nevertheless, there are many who are strongly attached to the view that past
> temperature variations were significantly larger and that, consequently,
> the warming trend seen in recent decades should not be considered
> as unusual.
>
>
> The criticism has been directed mainly at the \cite{mann_etal1998a, mann_etal1999}
> work.
> Therefore, this section focuses mainly on this criticism.
> %new
> Though some of the critics identify the consensus with the MBH1998 work,
> this is not the case: the consensus rests on a broader body of work, and
> as formulated by IPCC2001 is less strong than the conclusions of
> MBH1998 (Sect.~3.2).
> \cite{mcintyre_mckitrick2003} [MM2003]
> criticize MBH1998 on many counts, some related to deficiencies
> in the description of the data used and possible irregularities in the data
> themselves. These issues have been largely resolved in \cite{mann_etal2004}.
> %%\footnote{ftp://holocene.evsc.virginia.edu/pub/MANNETAL1998}.
>
> As noted above, the MBH1998 analysis is considerably more complex than others,
> and uses a greater volume of data.
> There are 3 main stages of the algorithm: (1) sub-sampling of
> regions with disproportionate numbers of proxies, (2) regression,
> (3) validation and uncertainty estimates.
>
> Stage (1) is necessary because some parts of the globe, particularly
> North America and Northern Europe, have a disproportionate number of
> proxy records. Other authors have dealt with this by using only
> a small selection of the available data or using regional
> averages \citep[BOS2001;][]{hegerl_etal2006+}. MBH1998
> use a principal component analysis to extract the common signal from the records in
> densely sampled regions.
>
> The failure of MM2003 to replicate the MBH1998 results is partly due to
> a misunderstanding of the stepwise reconstruction method. MBH1998 use
> different subsets of their proxy database for different time periods.
> This allows more data to be used for more recent periods.
>
>

> For example, Fig.~2 illustrates
> how the stepwise approach applies to the North American tree ring network.
> Of the total of 212 chronologies, only 66 extend back beyond 1400AD.
> MM2003 only calculate principal components for the period when all
> chronologies are present. Similarly, MBH1998 use one principal
> component calculated from 6 drought sensitive tree-rings chronologies from South West Mexico
> and this data is omitted in MM2003.
> % [is this clear now?? (AM)]
> %new
> % Table 7 of MM2003 indicates only 20 series for the region, as the
> % supplementary information provided with MBH2003 omitted 2
> % \citep{mann_etal2004}.
> %endnew
> \cite{mcintyre_mckitrick2005a} [MM2005] continue the criticism of the techniques
> used by MBH1998 and introduce a ``hockey stick index": defined in terms of the ratio
> of the variance at the end of a time series
> to the variance over the remainder of the series.
> MM2005 argue that the way in which
> a principal component analysis is carried out in MBH generates an artificial
> bias towards a high ``hockey-stick index" and that the statistical significance of
> the MBH results may be lower than originally estimated.
>
> The issue arises because the tree ring chronologies are standardized:
> this involves subtracting a mean and dividing by a variance.
> MBH1998 use the mean and variance of the detrended series evaluated
> over the calibration period. MM2005 are of the view that this is
> incorrect.
> They suggest that each series should be standardised with respect to the
> mean and variance its full length.
>
> The code used by MM2005 is not, at the time of writing available,
> but the code fragments included in the text imply
> that their calculation used data which had been
> centred (mean removed) but had not been normalized to unit variance (standardised).
> Figure 3 shows the effect of the changes, applied to the
> North American tree ring sub-network of the data used by MBH1998,
> using those chronologies which extend back to 1400AD.
> The calculation used here does not precisely reproduce the archived MBH1998
> result, but the differences may be due to small differences in
> mathematical library routines used to do the decomposition.
> The effect of replacing the MBH1998 approach with centering and
> standardising on the whole time series is small, the effect of
> omitting the standardisation as in MM2005 is much larger:
> this omission causes the 20th century trend to be removed from the
> first principal component.
>
> \cite{storch_zorita2005} look at some of the claims made in MM2005
> and analyses them in the context of a climate simulation.
> They find the impact of the modifications suggested by McIntyre and McKitrick to
> be minor.
> \cite{mcintyre_mckitrick2005b} clarify their original claim, stating that the
> standardisation technique used by MBH98 does not create the ``hockey-stick" structure
> but does ``steer" the selection of this structure in principal component
> analysis.
>
> \cite{mcintyre_mckitrick2005c} [MM2005c] revisit the MM2003 work and correct
> their earlier error by taking the stepwise reconstruction technique into account.
> They assert that the results of MM2003, which show a 15th century
> reconstruction 0.5K warmer than found by MBH1998,
> are reproduced with only minor changes to the MBH1998 proxy data base.
> Examination of the relevant figures, however, shows that this is not entirely
> true. The MM2005c predictions for
> the 15th century are 0.3K warmer than the MBH1998
> result: this is still significant, but, unlike the discredited MM2003 result, it

```

> would not make the 15th century the warmest on record.
>
> MM20005c and \citet{wahl_ammann2005} both find that
> excluding the north American bristlecone pine data from the proxy
> data base removes the skill from the 15th century reconstructions.
> MM2005c justify this removal on the grounds that the first principal component
> of the North American proxies, which is dominated by the
> bristlecone pines, is a statistical outlier with respect to the joint distribution
> of  $\text{SR}^2$  and the difference in mean between 1400 to 1450 and 1902 to 1980.
> %%first ref to table 1
> Table 1, which lists a range of proxies extending back to 1000,

>
> \section{Varying methods vs. varying data}
>
> One factor which complicates the evaluation of the various reconstructions is
> that different authors have varied both method and data collections. Here we will
> run a representative set of proxy data collections through two algorithms:
> inverse regression and scaled composites. These two methods, and the different
> statistical models from which they may be derived, are explained in the
> Appendix A.
>
> Esper et al. (2005) investigated the differing calibration approaches used in the recent literature, including
> regression and scaling techniques, and concluded that the methodological differences in calibration result in differences
> in the reconstructed temperature amplitude/variance of about 0.5K.
> This magnitude is equivalent to the mean annual temperature change for the Northern Hemisphere reported in the last
> IPCC report for the 1000-1998 period.
> \cite{burger_etal2006} take another approach and investigate a family of 32 different regression algorithms
> derived by adjusting 5 binary switches, using pseudo-proxy data.
> They show that these choices, which
> have all been defended in the literature, can lead to a wide variety of different
> reconstructions given the same data.
> They also point out that the uncertainty is greater when we
> attempt to estimate the climate of periods which lie outside the range experienced
> during the calibration period. The relevance of this point to the last millennium is
> under debate: the glacier based temperature estimates of OER2005 suggest that the
> coldest northern hemisphere mean temperatures occurred close to the start of
> the instrumental record, in the 19th century. The borehole reconstructions,
> however, imply that there were colder temperatures experienced in the 16th to 18th centuries.
> For the question as to whether the warmth of the latter part of the calibration
> period has been experienced in the past, however,
> this particular issue is not directly relevant.
>
> As noted above, much of the MBH1999 algorithm is irrelevant to reconstructions

```

> prior to AD 1450, because before that date the data only suffice,
> according to estimates in that paper, to determine one degree of freedom.
> Hence, we will only look at direct evaluation of the hemispheric mean temperature.
>
> Several authors have evaluated composites and calibrated those composites
> against instrumental temperature. Many of the composites contain more samples in later
> periods, so that the calibration may be dominated by samples which do
> not extend into the distant past. Here, we will restrict attention to
> records which span the entire reconstruction period.
> The data series used are listed in table 1.
>
> \subsection{Proxy data quality issues}
>
> As noted previously, there has been especially strong criticism of
> MBH1998, 1999, partly concerning some aspects of their data collection.
> Figures 4 and 5 show reconstructions made using the MBH1999 and MBH1998 data respectively.
> Regression against northern hemispheric mean temperature from 1856 to 1980 is used
> instead of regression against principal components of
> temperature from 1902 to 1980. There are differences, but key features remain.
> MM2003 draw attention to the fact that one time series,
> ``CANA036'' in the ITRDB classification, contributed
> by Gasp\`e, appears twice in the MBH1998 database.
> This error is corrected in the red dashed curve of Fig.~5,
> which is almost identical to the green curve, which retains the duplication.
>
> \subsection{Reconstruction using a union of proxy collections}
>
> The following subsection will discuss a range of reconstructions using different
> data collections. The first 5 of these collections are defined as those proxies used by
> JBB1998, MBH1999, ECS2002, MSH2005 and HCA2006, respectively, which extend back to 1000AD.
> These will be referred to below as the JBB, MBH, ECS, MSH, HCA composites below
> to distinguish them from the composites used in the published articles, which include
> additional, shorter, proxy data series.
> Finally there is a `Union' composite made using 19 independent northern
> hemisphere proxy series marked with ``*'' in table 1. Apart from the China composite
> record, all the data used are individual series. The PCs used by MBH1999 have been
> omitted in favour of individual series used in other studies.
> Two southern hemisphere tropical series, both from the Quelcaya glacier, Peru,
> are included ensure adequate representation of tropical temperatures.
> This 'Union' collection contains 11 tree-ring series, 4 ice-cores, and one each of
> coral, speleothem, lake sediment and a composite record including historical data.
>
> \subsection{Intercomparison of proxy collections}
>
> Figure 6 shows reconstructions back to 1000AD using
> composites of proxies and variance matching [CVM] (for the proxy
> principal components in the MBH1998, MBH1999 data collections the sign
> is arbitrary: these series have, where necessary, had the sign reversed so that
> they have a positive correlation with the northern hemisphere
> temperature record).
> Surprisingly, the `Union' does not lie in the range spanned by the other reconstructions,
> and reaches colder temperatures than any of them. It does, however, fit the calibration period
> data better than any of the sub-collections.
>
> The reconstructions shown in Fig.~7 use the same data as is used: this time
> using inverse regression [INVR] (Appendix A), as used by MBH1998
> (the method used here differs from that of MBH1998 in using northern hemisphere
> temperature to calibrate against, having a longer calibration period,
> and reconstructing only a single variable instead of multiple EOFs).
> The spread of values is substantially increased relative to the CVM reconstruction.
>
> With INVR, only one reconstruction (that using the ECS2001
> data) shows temperatures warmer than the mid 20th century.
> The inverse regression technique applies weights to the
> individual proxies which are proportional to the

> correlation between the proxies and the calibration temperature
> signature.
> For this time series the 5 proxies are weighted as:
> 1.7 (Boreal); 2.9 (Polar Urals); 1.7 (Taymir); 1.8 (Tornetraesk); and 2.3 (Upper Wright).
> Firstly, it should be noted that this collection samples North America and the
> Eurasian arctic only. The bias towards the arctic is strengthened by the weights
> generated by the inverse regression algorithm, such that the reconstruction has poor geographical coverage.
>
> The MBH1999 and HPS2000 published reconstructions are shown in Fig.~6 for comparison: the MBH1999
> reconstruction lies near the centre of the spread of estimates, while the HPS2000 reconstruction
> is generally at the lower bound.
>
> Much of the current debate revolves around the level of
> centennial scale variability in the past.
> The CVM results generally suggest
> a low variance scenario comparable to MBH1999. The inverse regression
> results, however, suggest greater variability. It should be noted
> that the MBH1999 inverse regression result use greater volumes of
> data for recent centuries, so that the difference in Fig.~7 between the
> dashed red curve and the full green curve in the 17th
> century is mainly due to reduced proxy data input in the latter
> (there is also a difference because MBH1999 used inverse regression
> against temperature principle components rather than northern hemisphere
> mean temperature as here).
>
> Table 2 shows the cross correlations of the reconstructions in Fig.~6,
> for high pass (upper right) and low pass (lower left) components
> of the series, with low pass being defined by a 40 year running mean.
> The low pass components are highly correlated.
>

>
> The significance of the correlations between these five proxy data samples
> and the instrumental temperature data during the calibration period (1856-1980)
> has been evaluated using a Monte-Carlo simulation
> with (1) a first order Markov model and (2) random time series
> which reproduces the lag correlation structure of the data samples (see Appendix A).
> Figure 8 shows the lag correlations. The instrumental record had a pronounced
> anti-correlation on the 40 year time-scale. This may be an artifact of the short
> data record, but it is retained in the significance calculation as the best available
> estimate which is independent of the proxies.
> The 'Union' composite shows multi-centennial correlations which are not present in the other data.
> The MBH and JBB composites clearly underestimate the decadal scale correlations, while
> the HCA and 'Union' composites overestimate it.
> %%first ref to table 3

> \conclusions\label{sec:end}

>
> There is general agreement that global temperatures cooled
> over the majority of the last millennium and have risen sharply
> since 1850. In this respect, the recent literature has not produced
> any change to the conclusions of JBB 1998, though there remains
> substantial uncertainty about the magnitude of centennial scale variability
> superimposed over longer term trends.

>
> The IPCC 2001 conclusion that temperatures of the past millennium
> are unlikely to have been as warm, at any time prior to the 20th
> century, as the last decades of the 20th century is supported
> by subsequent research and by the results obtained here.

>
> The greatest range of disagreement among independent
> assessments occurs during the coolest centuries, from 1500 to
> 1900, when the departure from recent climate conditions
> was strongest and may have been outside the range of
> temperatures experienced during the later
> instrumental period.

>
> There are many areas of uncertainty and disagreement within
> the broad consensus outlined above, and also some who
> dissent from that consensus. Papers which claim to refute the
> IPCC2001 conclusion on the climate of the past millennium have been
> reviewed and found to contain serious flaws.

>
> A major area of uncertainty concerns the accuracy of the long time-scale
> variability in the reconstructions. This is particularly
> so for timescale of a century and longer. There does not appear to be any
> doubt that the proxy records would capture rapid change on
> a 10 to 50 year time scale such as we have experienced in recent decades.

>
> Using two different reconstruction methods on a range of proxy data
> collections, we have found that inverse regression
> tends to give large weighting to
> a small number of proxies and that the relatively simple
> approach of compositing all the series and using variance matching to
> calibrate the result gives more robust estimates.

>
> A new reconstruction made with a composite of 19 proxies extending back
> to 1000AD fits the instrumental record to within a standard error of 0.149K.
> This reconstruction gives a maximum pre-industrial temperature of 0.227K
> relative to the 1866 to 1970AD mean. The maximum temperature from the
> instrumental record is 0.841K, over 4 standard errors larger.

>
> The reconstructions evaluated in this study show considerable disagreement
> during the 16th century. The new 19 proxy reconstruction implies 21-year mean
> temperatures close to 0.6K below the 1866 to 1970AD mean. As this reconstruction
> only used data extending back to 1000AD, there is a considerable volume of 16th century
> data which has not been used. This will be a focus if future research.

> \vfill\ject

>
> \def\thesection{A}
> {\bf Appendix A: Regression methods}

>
> Ideally, the statistical analysis method would be determined by the
> known characteristics of the problem. Unfortunately, the error
> characteristics of the proxy data are not sufficiently well
> quantified to make the choice clear.
> This appendix describes two methods and the statistical models which can be
> used to motivate them.

>
> \subsection{Inverse regression [INVR]}

>
> Suppose x_{ik} , $i=1, N_{pr}$, $k=1, L$ is a set of N_{pr}
> standardised proxy records of length L and that we are trying
> to obtain an estimate \hat{y}_i of a quantity y_i which is
> known only in a calibration period (i in C).

>
> Several "optimal" estimates of y_i can be obtained, depending on
> the hypothesised relation between the proxies and y .

>
> Inverse regression follows from the model

> \$\$

> $\beta_i y_k + \mathcal{N}$

> =

> x_{ik}

> \$\$

> where \mathcal{N} is a noise process, independent between proxies.
> It follows that optimal estimate for the coefficients β_i are

> \$\$

> $\hat{\beta}_i = \frac{\sum_{k \in C} x_{ik} y_k}{\sum_{k \in C} y_k^2}$

> .

> \$\$

> Given these coefficients, the optimal estimate of the y_k outside
> the calibration period is

> \$\$

> $\hat{y}_k = \frac{\sum_i \hat{\beta}_i x_{ik}}{\sum_i \hat{\beta}_i^2}$.

> \$\$

>
> \subsection{Composite plus variance matching [CVM]}

>
> This method is rather easier. It starts out from the hypothesis that different
> proxies represent different parts of the globe. A proxy for the global mean
> is then obtained as a simple average of the proxies:

> \$\$

> $\overline{x}_k = N_{pr}^{-1} \sum_i x_{ik}$

> .

> \$\$

>
> Suppose

> \$\$

> $\overline{x}_k = \beta y_k + \mathcal{N}$

> ,

> \$\$

> then an optimal estimate of β is easily derived as

> $\hat{\beta} = \frac{\sum_{k \in C} \overline{x}_k y_k}{\sum_{k \in C} y_k^2}$.

> However, $y_k^* = \hat{\beta}^{-1} \overline{x}_k$ is not an optimal estimate
> of y_k .

>
> Because of the added noise, \overline{x}_k is generally an overestimate
> of βy_k . To correct for this we should use:

> \$\$

> $\beta y_k^* = \overline{x}_k$

> $\sqrt{\frac{\beta^2 \sigma_y^2}{\beta^2 \sigma_y^2 + \sigma_{\mathcal{N}}^2}}$

> ,

> \$\$

> where σ_y^2 and $\sigma_{\mathcal{N}}^2$ are the expected variance of y and the
> respectively.

> This leads to an estimate:

> \$\$

> $y_k^{*} = \overline{x_k} \left(\frac{\sigma_y}{\sigma_x} \right)$

> .

> \$\$

> This is known as the variance matching method because it matches the

> variance of the reconstruction with that of observations over

> the calibration period.

>

> \def\thesection{B}

> \setcounter{subsection}{0}

> {\bf Appendix B: Statistical tests}

>

>

> \subsection{Tests for linear relationships}

>

> The simplest test for a linear relationship is the anomaly correlation

> (also known as: Pearson Correlation, Pearson's product moment correlation, R^2 ,

> product mean test):

> \be

> $R = \frac{\overline{y^{\prime} x^{\prime}}}{\sqrt{\overline{y^{\prime 2}} \overline{x^{\prime 2}}}}$

> \ee

> where the over-bar represents a mean over the data the test is being applied to,

> and a prime a departure from the mean

> \citep{pearson1896}.

>

> The significance of an anomaly correlation can be estimated using the

> t statistic:

> \be

> $t = \frac{R \sqrt{n-2}}{\sqrt{1-R^2}}$

> \ee

> where n is the sample size (for independent variables).

> Two Gaussian variables will produce a t statistics which obeys the

> Student's t -distribution of $n-2$ degrees of freedom.

>

> Ideally, if the noise affecting all the x and y values is independent,

> n is simply the number of measurements. This is unlikely to be the case,

> so an estimate of n is needed. The Monte-Carlo approach is more

> flexible: a large sample of random sequences with specified correlation

> structures is created, and the frequency with which the specified

> R coefficient is exceeded can then be used to estimate its significance.

>

> \subsection{Lag correlations}

>

> Following \cite{hosking1984}, a random time series with a specified

> lag correlation structure is obtained from the partial correlation coefficients,

> which are generated using Levinson-Durbin regression.

>

> It is, however, not possible to generate a sequence matching an arbitrarily

> specified correlation structure and there is no guarantee that an

> estimate of the correlation structure obtained from a small sample will

> be realizable. It is found that the Levinson-Durbin regression diverges

> when run with the lag correlation functions generated from the \cite{jones_etal1986}

> northern hemisphere temperature record and also that from the HCA composite.

>

> For the northern hemisphere temperature record, this is resolved by truncating the regression after $n=50$.

> The sample lag-correlation coefficients are, in any case, unreliable beyond this point.

> Truncating the regression results in a random sequence with a lag correlation fitting that

> specified up to lag 50 and then decaying.

> For the HCA composite, the sample lag-correlation, $C(n)$, is scaled by $\exp(-0.0001 n)$,

> where n is the lag in years.

Dear Chris

just wondering what became of my forwarded request (from you to Tony) ? Have not received any feedback and still anxious to follow this up

cheers

Keith

At 15:53 17/10/2003, you wrote:

Keith,

I am inclined to forward your note to Tony Caprio - any objections?

He has the best temperature sensitive foxtail pine material I am aware of.

I have some sense that there is a change in regional climate patterns prior to 1000AD in the western US. Not sure what or why...

Matt Salzer and Malcolm Hughes are working on 3k yr material from temperature sensitive upper tree-line sites in the west.

John King knows a great deal about the Sierra collections and data.

MaryBeth Keifer and Andrea Loyd-Faste collected the Sierra Foxtail you referred to.

Chris B.

Hans
just too bogged down with stuff to even read their crap - but I have no intention of withholding anything. Will supply the stuff when I get five minutes!! no idea what the so-called update stuff is about

Keith
At 11:19 05/08/2006, you wrote:

Dear Keith,
I read this comment on the prometheus-weblog of Roger Pielke jr:
"Ask Briffa for site identifications for Briffa et al 2001? While you're at it, ask him for the measurement data for Taimyr, Tornetrask update and Yamal? Ask Briffa why he didn't publish the updated Polar Urals results."

The background of this inquiry seems to be the replicability of your studies. I think this is a reasonable request, but some people claim that you would "stonewall" any such attempts. ("The issue of data access was discussed in the dendro conference in Beijing - some people suggesting that withholding data was giving the trade a black eye. Industry leaders, such as presumably Briffa, said that they were going to continue stonewalling.") I can not believe this claim, and I would greatly appreciate if you would help me to diffuse any such suspicions.

As you possibly have heard, I had a chance to hear a lot what is said on Capitol Hill (see attachment) - and I am concerned if we do not apply a truly open data and algorithm-policy, our credibility will be severely damaged, not only in the US but also in Europe. "Open" means also to provide data to groups which are hostile to our work - we have done so with our ECHO-G data, which resulted in two hostile comments in "science", which were, however, useful as they helped to clarify some issues.

All the best,

Hans

Dear Keith,

I think we have to take this talking and questioning seriously. what we do is important and we have to allow for replication. when we were confronted with such requests concering the ERIK-simulations, we were initially reluctant, but now we gove teh data to verybpody. Got us two critical comments in "science" but I think it was worth it.

Do you mind if I publish your response? Would be the prometheus weblog. I could ask what is meant with "update" - I do know not what is meant; I had just quoted a request which I find in principle not unreasonable - and I am happy to hear that you in principle agree.

Regards,
Hans

Hi Keith:

Thanks so much for the chance to look over this section. I think the long section you added on pp 6-5 and 6-6 reads well, and makes good sense according to what I know. Indeed, reading the whole section is a good review for me!

I suggested addition of a phrase in lines 32-33 on page 6-3 regarding MM 2003 and analysis of it by Wahl-Ammann 2006. I also suggest a (logically useful) change from singular to plural in line 42 of that page. The changes are in RED/BOLD font.

[I should note that AW 2006 is still in "in press" status, and its exact publication date will be affected by publication of an editorial designed to go with it that Caspar and I are submitting this weekend. Thus I cannot say it is certain this article will come out in 2006, but its final acceptance for publication as of 2/28/06 remains completely solid.]

Also, I added the full information for the Wahl-Ritson-Ammann 2006 Science article in the references section, also in RED/BOLD font.

By the way, is the "AJS" NCAR-CSM model in Fig. 6-13 the one Caspar did? I couldn't tell this for sure from the information in the text. If it is, perfect. If not, is there a way to include his millenium run?

Thanks to you and all the authors for you painstaking work.

Peace, Gene

First Gene - let me say that I never intended that you should spend

so much time on this - though I really appreciate your take on these points. The one you highlight here - correctly warns me that in succumbing to the temptation to be lazy in the sense of the brief answer that I have provided - I do give an implied endorsement of the sense of the whole comment. This is not, of course what I intended. I simply meant to agree that some reference to the "divergence" issue was necessitated . I will revise the reply to say briefly that I do not agree with the interpretation of the reviewer. I am attaching what I have done (see blue highlighting) to the section in response to comments (including the addition of the needed extra section on the "tree-ring issues" called for by several people). I have had no feedback yet on this as it has not been generally circulated , but thought you might like to see it. PLEASE REMEMBER that this is "for your eyes only " . Please do NOT feel that I am asking /expecting you to go through this in any detail - but given the trouble you have taken,I thought it reasonable to give you a private look. Cheers
Keith

Hi Mel - thanks. Since chap 6 CA Tim Osborn is an author on this paper, I'm sure he and Keith have made the right call.

Thanks again, Peck

Hi Peck and Eystein,
Although the deadline for additional accepted papers has now passed, this submission comes from a CLA (Gabi Hegerl) so am forwarding on. Official acceptance of the Tett et al. paper was 2 June. My understanding is that you already have a copy, but will forward the copy sent in by Simon just in case.
Cheers,
Mel

Subject: comments to mitrie manuscript  
Date: Thu, 17 Aug 2006 12:31:28 +0200

077

Due to the ongoing debate, this has turned an even more difficult manuscript. In general, I think Martin did a very good job in the review of the literature. Concerning the new reconstructions and the evaluation of McIntyre work, I would not fully agree with some of the conclusions, which I thin do not follow from the material presented in the text. I have some remarks on this which you may consider useful. But I think that I am not the one that should give the manuscript the final shape, as Martin is the person in charge of the project. Please, consider the following comments as suggestions.

eduardo

Consensus: I would tend to avoid the word 'consensus', since it is not a well defined concept.

Depending on the meaning of consensus, each would agree with it to a certain degree. I would prefer to refer to a particular IPCC conclusion, or something similar. I think this review of the literature is very well written and informative, but I am not sure that each one of us will agree with each one of the concussions of each of the papers.

Page 12, section 2.8. I think the text is somewhat vague here, and it could be misunderstood.

Mann et al (2005) tested the RegEM method, not the original MBH98 method. It is true that applied to the real proxies both methods, according to Mann, yield very similar results. But strictly speaking , Mann did not test the MBH98 method in the CSM simulation. The MBH98 method is thereby only by implication

I tested the the sensitivity of the MBH98, and not of RegEM, to the length of the calibration period. It may be the RegEM is less sensitive or not at all. Figure 4 and 5, if I understood well, support this dependency of MBH to the calibration period. Am I correct to interpret the large differences between the original MBH reconstruction (dashed red) and the black curve as due to the different calibration period (1901-1980 versus 1856-1980) and to the use of the leading PC or NHT as calibration target? At least in the period prior to 1600 I think these are the only methodological differences between both curves (?).

My interpretation of this figure is also somewhat different. If the final reconstructions differs so strongly by using a longer calibration period (in general yielding stronger decadal variability in the reconstruction)

I would tend to think that the method based on these proxies is quite unstable. What would happen if the calibration period could have been extended to 1800, for instance?.

Page 15: top. The role of forcing on the global or NH T is also recognized in the correlation between the NHT simulated by ECHO-G and CSM for the millennium. For the case of a second ECHO-G simulation (/Gonzalez-Rouco et al.) the agreement is very close at 30-year timescale.

Section 3, beginning.

In my opinion, MM05 stress the inadequacies and uncertainties in the MBH work, but they not put forward their own reconstruction implying a warmer-than-today MWP. They believe that this is true, but in their works so far, at least to my knowledge, they do not assert that the MWP was warmer than present, only that the uncertainties are too large for such a claim.

Section 3: Consensus. This paragraph may be problematic. Again what is the consensus? If we look at the recent NAS report, which again not every one would agree with, the 'consensus' is reduced to the past 400 years in comparison to IPCC, leaving ample space for speculation before this period. Does the NAS report belong to the consensus? perhaps partially, but I am not sure to what extent.

Section 3, discussion of MM05 and hockey-stick index. I have here a certain level of disagreement with these paragraphs. The issue raised by MM05 would be that the de-centering of the proxies prior to the calculations of the principal components tends to produce hockey-stick-shaped leading PC. I think this effect is true, at least with spatially uncorrelated red-noise series. It can be easily verified and it has been recognized in the NAS, the Wegman report and by Francis Zwiers. To be fair, following this issue is the problem of the truncation- just to keep the leading PC or further Pcs down the hiercharchy, and if this is done, the final differences could be probably minor. in the final reconstructions. But the paragraph implies, in my opinion, that this criticism by MM05 has no grounds, which as I said is problematic and could open the manuscript with criticisms based on these recent reports.

I think that the calculation shown in Figure 3 is very useful, as it boils down to the issue raised by MM05: how relevant is the de-centering and standardization with real proxies?. Apparently, I get a different message from Figure3 (although I may have misinterpreted the text). I see quite large differences in the 20th century between the original MBH leading PC and the 'correct' calculation (whole period centering and standarization, blue line). Only the original MBH PC shows a positive trend in the 20th century. The blue lines seems even to show a negative trend or no trend at all. If this PCs were to be used in the MBH regression model (with trend included in the calibration) the results could be quite different. I would tend to think that this figure actually supports the MM05 criticism, since the hockey-stick shape of the leading PC disappears.

Section 3, end, bristlecone pines. I am also worried by this paragraph. The recent NAS report clearly states that the bristlecone pines should not be used for reconstructions in view of their potential problems. They cite previous analysis on this issue. I think that to refer to just one study indicating no fertilization effect could not be enough. However, I am not a dendroclimatologist. This could open the door to potential problems.

Section 4, end. years 1997 and onwards were the warmest in the millennium. I see here also potential problems with this claim, and I do not see the need to make our lives more complicated. The NAS report expressed that the uncertainties are too large for this type of conclusion and certainly this conclusion would attract some attention from the reader. I see two lines of criticism on this: one is that the standard errors have been calculated with the calibration residuals and these are an underestimation of the true uncertainties. A reviewer may require that the uncertainty range be calculated by cross-calibration or bootstrapping. In the case of CVM perhaps this effect is not very important, as there is just one free parameter, but in the case of inverse regression there are much many more free parameters and the true uncertainties can be quite different from those estimated from the calibration residuals. This potential criticism could be exacerbated by the fact that the new reconstruction has not been tested in a validation period.

The other line of criticism could be that the calibration period has been, as in all reconstructions, a priori truncated -data after 1980 are not considered as the proxies are known to not follow the temperature. Strictly speaking this truncation can be only justified by a credible physical explanation about the cause of this divergence. Statistically, I think it is not correct to a priori ignore some data because they do not fit. If one does so, I think the uncertainty range should be enlarged to encompass the possibility that this divergence could have happened in the past, i.e. an additional standard deviation of the instrumental NH T in the period 1980-2000 (or perhaps more correct, the square root of the sum of the error variance and the NHT variance in 1980-2000). Alternatively, one could include the period 1980-2000 in the calibration and due to the divergence the standard errors would grow, but perhaps this is practically not possible as the proxy time series may not have been archived for the last 20 years.

Section 5, conclusions.

I share the worry of Anders Moberg about the wording 'serious flaws' in the analysis of MM05. This sentence would be based on Figure 3, if I understood properly, but as I said I think Figures 3 actually does not support this conclusion.

Finally, I think it would strategically better to avoid conflicts on the particular point of whether some particular year was the warmest of the millennium or not, and to stress the fact that all reconstructions, also the new ones presented in the manuscript (with one exception) show MWP temperatures lower than late 20th century temperatures.

Another conclusion could be, in my view, that the average temperature in the cold centuries in the millennium seems to be still quite uncertain. The new reconstructions, or the calculation of the leading PCs of the proxies, seem to be still quite sensitive to particular choices in the statistical set-up.

Hi Keith,

If the offer still stands, we wanted to get from you the ECHO-G surface temperature field, so we can do some tests of RegEM with this. So far we've only tested on CSM 1.4 and it would be nice to test this on on ECHO-G, especially since other groups apparently now also have the ECHO-G output (e.g. Mark Cane's group and Francis Zwiers' group).

Thanks in advance for any help w/ this,

mike

Hi Keith,

John should have the latest versions of the comments file and the chapter text, i.e. the ones that went out for LA review this summer. I believe he is after some more specific answers in the comments and not so much changes to the text, and has selected the bristlecone issue, the divergency issue and the verification and robustness issues. If you are unsure what comments or tetx he refers to, I think the best thing is for to ask John for the specific comments he thinks are not adequate, or the specific lines of text which he suggests changed. It seems he needs some reassurance rather than you writing much new in terms of comments and text, so the best would be to talk to him and ask what he needs you to do to the documents.

Best wishes,

Eystein

Hi Keith

I have tried to condense what I think the main issues for the and what the response is below. The weakest area seems to be statistical significance and by implication the likely/ very likely statements. I can't think of any easy solution - in the TAR for detection and attribution we used 95% limits on stats tests and then downrated them to allow for other uncertainties.

I am interested in your comments

John

Issues

1. Reliance on Bristlecone pine -

Response - the issues are in calibration period- they agree with other indicators for the rest of the record

2. Centring of principle components leads to "hockeysticks"-

Response - this makes only a small difference when standardised data used.

Comment - Would be useful to know which reconstructions do and donot make this assumption- this could strengthen the response

3. The divergence issue-

Response - it is only apparent in high latitudes, and only with some trees.

Comment- Do we know what happens if we eliminate those records with a divergence problem. The wider issue is whether or not it is reasonable to extend the reconstructions outside the calibration range.

4. There are different ways of verifying reconstructions and assigning significance levels( calibration period or seprate verifying period, different statistics)

Response ?

Comment- it is difficult in the text to gauge how well reconstructions are validated - eg using the calibration period to estimate errors as opposed to an independent period clearly makes a difference. This is important where "likely", "very likely"are used-

based on what statistics? I think this is the area where I think the current response is weakest

5. Robustness- Burger and Cubasch show a wide range of results using different assumptions-

Response ?

Mann makes a reasoned defence- there are other checks and tests which would rule out many of the arbitrary assumptions explored by Cubasch and Burger, but this is not clear in the response to M&M etc

Jonathan,

I haven't looked at these in great detail, but I have a problem with Martin making suggestions about the TSU Exec Summary for chap 6. Weren't these decided by consensus among the Chap 6 authors? Why does Martin have any say about this? Clarification is one thing, but some of these suggestions seem to be 'leading'. I think we should be very cautious about changing anything substantive here at the last moment. [This is the expurgated version of what I really thing.]

Hi all - today has been a hectic one, with lots of good input from multiple folks. In the end, we agreed to stick with our existing bullets, which changes only where they would improve the clarity of what we were saying. Please check the attached - need Fortunat's detailed look in particular. Changes are all in yellow highlight. Two special issues:

1) There is still concern that this bullet is too vague to be as useful as it could be:

o It is very likely that the global warming of 4 to 7 °C since the Last Glacial Maximum (ca. 21,000 years ago) occurred at an average rate about ten times slower than the warming of the 20th century.

but, perhaps the safest thing would be to leave as is.

2) As for the 1998/2005 warmest in last 1000 years issue, we suggest adding nothing new to the ES, in line with our chapter policy from Bergen, BUT adding something in the chapter along the lines of: " There is currently insufficient knowledge to form a consensus on the issue of how the warmth of individual years of the last 100 years compare with individual years of the last 1000 years" Keith, would you like to make a suggestion on the wording and placement?

The reasoning expressed by Stefan on this issue is undoubtedly shared by others outside our team, and perhaps a paper be written on this key topic to help the community reach better consensus.

Thanks for your continued dialog and work! Have a good weekend.

best, Peck and Eystein

dear All, thanks for being alert.

I think we have an agreement that Martin's comments are useful, but that we should change only those sentences where they clarify. Otherwise i agree with Stefan and Keith's statements below.

Eystein

At 15:45 +0100 01-09-06, Keith Briffa wrote:

I forgot to say that I too disagree with removing the first sentence re simulations

being consistent with reconstructed NH temps. As Stefan says we need the context , and our results are independent of Chapter 9 in this regard.

Keith

At 15:37 01/09/2006, Stefan Rahmstorf wrote:

Hi Peck,

Martin as in Manning? I have found his feedback very useful so far, so we should definitely look at what he suggests - he mostly tends to look for whether our sentences are clear. Obviously, he cannot suggest real changes in meaning, only issues of clarity, but the latter I would take very seriously. Mostly I find his small rewordings good, I comment on the larger points and exceptions below.

- I am against deleting the bullet on speed of deglacial change. This point is extremely effective. Just two days ago an oil industry person told me that there have been big natural climate changes like ice ages in the past, hence we need not worry. I responded that the biggest warming in recent climate history was the end of the last Ice Age - but that warming by about 5 °C took about 5,000 years, not a hundred. "Oh" he said, "Really so long? I didn't know that." I think it is a very important point, we need to make it. Maybe not in term of "average rate", may we should just say: the warming of 4-7 °C took about 5,000 years, as compared to a future change of up to the same magnitude within a century.

- Next ice age bullet in 30k seems fine to me.

- exceptional warmth: the SPM said:

20th C T increase likely the largest in a millennium - that is strengthened (perhaps very likely now?)

1990s likely the warmest decade in a millennium - that again is strengthened

1998 likely the warmest year - I'd say this is unchanged (except for 2005 challenging it), likely is only 66%! Even though the annual proxy data may be uncertain, as a physicist I would find it unlikely that there is a mechanism to cause a big warm outlier year that beats 1998 from a much cooler background state. How would that work - where would the heat come from?

So in my view we could actually say that these past SPM statements held up or were strengthened - but in fact I also like the bullet as it is.

- Paleoclimate model simulations are broadly consistent with the reconstructed NH temperatures over the past 1000 years. The rise in surface temperatures since 1950 very likely cannot be reproduced without including anthropogenic greenhouse gases in the model forcings, and it is very unlikely that this warming was merely a recovery from the pre-20th century cold period.

On this I disagree with deleting the first sentence, as the second one needs it to follow logically. And why should the paleo chapter suddenly make a statement on post-1950 warming, if it is not in the context of the past millennium?

Cheers, Stefan

Keith, Stefan

Its not my role as review editor to tell you what to write, just to make sure you have responded to the reviewers comments. For what its worth, I did find Keith's text quite involved. However, you do need to respond the the reviewers comments on Burger etc - if the flaws in von Storch paper cast doubt on the subsequent papers, then why not include a sentence in the chapter that says so, and list just the key papers affected.

I hope this helps

john

Subject: Re: Fwd: Re: [Wg1-ar4-ch06] NEW DRAFT FOR LA REVIEW

Dear Keith,  
you disagree with my proposed revision of the paragraph re. the Von Storch papers, but you do not give any reasons or arguments for that. I think there are some good reasons to shorten this discussion and to clarify it, and I would welcome to hear your reasons against it.  
Firstly, I think your original discussion was too long and complex to understand for non-specialists, and, at this level of detail, not policy-relevant. It took up a disproportionate amount of space for what we can learn from it.  
Secondly, I don't think we need to cite all those Storch-spinoff papers by Bürger/Cubasch. Most people whose judgement I value (e.g., David Ritson, who I think has no vested interest but a very detailed knowledge of the issue) think these papers are irrelevant at best and misleading at worst (he actually has used stronger wording). You may also have seen that the latest in this series, making similar points, is highly criticised by anonymous reviewers on the open discussion site of the journal *Climate of the Past*, where one reviewer (this is not the even more scathing review by Mann) recommends rejection of the Bürger/Cubasch paper because of "numerous errors and inaccuracies in the use of statistical concepts and methods".  
Third, if we cite Von Storch et al. 2004 we need to be very clear that a number of key statements are simply incorrect, which is a fact that is not in dispute and documented in the literature. They implemented the Mann et al. method incorrectly, and it is at least unclear whether in their follow-up paper they have now fixed this (Ritson, who discovered

the problem in their original paper in the first place, thinks they still have a problem, the detrending step was not the only one - and certainly in no paper have VS et al. shown any test that verifies their algorithm). Also, they were hiding a major artificial climate drift (which they must have known about, and which makes up half of their climate signal) - it is at least unclear whether you can expect a proxy method based on physical patterns of climate variability to reconstruct an unphysical drift, which has a completely different pattern. I simply think that because of this flaw, we cannot trust or cite any results from this particular ECHO-G run, which also affects several of the Bürger/Cubasch papers using the same data set. Given that the VS04 paper was used in the US Senate and other high-profile fora to discredit IPCC, I think it is imperative that we clarify this and leave our readers in no doubt about the fact that the VS04 results have proven to be incorrect in a major way.

I am aware that you authored a favorable Science Perspective on the VS04 paper at the time, but you could not have known of those errors back then, and for a long time I thought myself that it was a valid paper. Therefore, if we state clearly in our chapter what is wrong with it, I do not think this would be a loss of face for you - quite the contrary. I also think you have done a brilliant job on the rest of the very difficult discussion of the past millennium.

Best wishes, Stefan

Tim, thanks a bunch. This all sounds very good. We're finalizing a pseudoproxy paper for JGR based on the various tests w/ the CSM simulation I showed in Wengen, and will send you a guys a copy once its finalized. A natural followup would be a similar analysis applying to the ECHO-G simulation, and we would enjoy collaborating w/ you and Keith on this. We were also thinking of doing some "mixed signal" analyses, where the pseudoproxies represent a combinatiion of temp and precip (including limiting cases of pure temp and pure precip). This might be a natural way to incorporate the ECHO-G results. We'll let you know if we have any trouble w/ format, etc.

thanks again,

mike

Cc: rahmstorf@ozean-klima.de, Bette Otto-Bleisner <ottobli@ncar.ucar.edu>, cddhr@giss.nasa.gov, joos <joos@climate.unibe.ch>, Eystein Jansen <eystein.jansen@geo.uib.no>, "Ricardo Villalba" <ricardo@lab.cricyt.edu.ar>, t.osborn@uea.ac.uk

Keith - thanks for this and the earlier updates. Stefan is not around this week, but hopefully the others on this email can weight in. My thoughts...

1) We MUST say something about individual years (and by extension the 1998 TAR statement) - do we support it, or not, and why.

2) a paragraph would be nice, but I doubt we can do that, so..

3) I suggest putting the first sentence that Keith provides below as the last sentence, in the last (summary) para of 6.6.1.1. To make a stand alone para seems like a bad way to end the very meaty section.

4) I think the second sentence could be more controversial - I don't think our team feels it is valid to say, as they did in TAR, that "It is also likely that, in the Northern Hemisphere,... 1998 was the warmest year" in the last 1000 years. But, it you think about it for a while, Keith has come up with a clever 2nd sentence (when you insert "Northern Hemisphere" language as I suggest below). At first, my reaction was leave it out, but it grows on you, especially if you acknowledge that many readers will want more explicit prose on the 1998 (2005) issue.

Greater uncertainty associated with proxy-based temperature estimates for individual years means that it is more difficult to gauge the significance, or precedence, of the extreme warm years observed in the recent instrumental record. However, there is no new evidence to challenge the statement made in the TAR that 1998 (or the subsequent near-equivalent 2005) was likely the warmest of Northern Hemisphere year over the last 1000 years.

5) I strongly agree we can't add anything to the Exec Summary.

6) so, if no one disagrees or edits, I suggest we insert the above 2 sentences to end the last (summary) para of 6.6.1.1. Or should we make it a separate, last para - see point #3 above why I don't favor that idea as much. But, it's not a clear cut issue.

Thoughts? Thanks all, Peck

Eystein and Peck

I have thought about this and spent some time discussing it with Tim. I have come up with the following

Greater uncertainty associated with proxy-based temperature estimates for individual years means that it is more difficult to gauge the significance, or precedence, of the extreme warm years observed in the recent instrumental record. However, there is no new evidence to challenge the statement made in the TAR that 1998 (or the subsequent near-equivalent 2005) was likely the warmest in the last 1000 years.

This should best go after the paragraph that concludes section 6.6.1.1

I believe we might best omit the second sentence of the suggested new paragraph - but you might consider this too subtle (or negative) then. I think the second sentence is very subtle also though - because it does not exclude the possibility that the same old evidence that challenges the veracity of the TAR statement exists now , as then!

I think this could go in the text where suggested , but I think it best NOT to have a bullet about this point. We need to check exactly what was said in the TAR . Perhaps a reference to the Academy Report could also be inserted here?

Anyway, you asked for a straw-man statement for all to argue about so I suggest we send this to Stefan, David , Betty and whoever else you think.

cheers

Keith

Leaving aside for the moment the resolution issue, the statement should at least be consistent with our figures. Fig. 6-10 looks like there were years around 1000 AD that could have been just as warm - if one wants to make this statement, one needs to expand the vertical scale in Fig. 6-10 to show that the current warm period is 'warmer'.

Now getting back to the resolution issue: given what we know about the ability to reconstruct global or NH temperatures in the past - could we really in good conscience say we have the precision from tree rings and the very sparse other data to make any definitive statement of this nature (let alone accuracy)? While I appreciate the cleverness of the second sentence, the problem is everybody will recognize that we are 'being clever' - at what point does one come out looking aggressively defensive?

I agree that leaving the first sentence as the only sentence suggests that one is somehow doubting the significance of the recent warm years, which is probably not something we want to do. What I would suggest is to forget about making 'one year' assessments; what Fig. 6-10 shows is that the recent warm period is highly anomalous with respect to the record of the last 1000 years. That would be what I think we can safely conclude the last 1000 years really tells us.

Hi all,

My take on this is similar to what Peck wrote. My suggestion is to write:

Greater uncertainty associated with proxy-based temperature estimates for individual years means that it is more difficult to gauge the significance, or precedence, of the extreme warm individual years observed in the recent instrumental record, such as 1998 and 2005, in the context of the last millennium.

I think this is scientifically correct, and in essence means that we, as did the NAS panel say, feel the TAR statement was not what we would have said. I sympathise with those who say that it is not likely that any individual years were warmer, as Stefan has stated, but I don't think we have enough data to qualify this on the hemispheric mean.

Best wishes,

Eystein

If this is interpreted as a criticism of the TAR, then I think we

At 14:09 -0600 13-09-06, Jonathan Overpeck wrote:

thanks David - lets see what others think. I agree, that we don't want to be seen as being too clever or defensive. Note however, that all the TAR said was "likely" the warmest in the last 1000 years. Our chapter and figs (including 6.10) make it clear that it is unlikely any multi-decadal period was as warm as the last 50 years. But, that said, I do feel your are right that our team would not have said what the TAR said about 1998, and thus, we should delete that second sentence.

any other thoughts team?

thx, peck

Leaving aside for the moment the resolution issue, the statement should at least be consistent with our figures. Thanks Keith, Tim and Fortunat for your input.

We'll go with what we have then - Eystein's suggestion minus the second "individual".

Eystein and Øyvind - just want to double check that you've deleted that 2nd "individual" in the all important 1998 sentence??

Thanks, Peck

Hi Oyvind,

I was off work yesterday so I couldn't check the tables until today. Keith and I have spotted some corrections that need to be made, some my mistakes and some due to other changes. Sorry! Anyway all are shown as tracked changes (plus explanation comments) in the attached file. Hope this is all clear and ok.

Cheers

Tim

At 17:02 13/09/2006, Øyvind Paasche wrote:

tim - that's very good, the minor error in box fig.1 is now corrected. I think the lines in fig.6.10 and 6.14 are sufficiently thick so if its up to me we'll leave them as they are. I believe that all the figures are incorporated into the Word file the same way and I can't see any big difference between 6.10 and 6.14. TSU have eps formats of all the figures and in the end they will probably use an entirely different program than Word to construct the report, so I guess there's nothing to worry about.

Anyway, I have cleaned the standing version of the tables (attached) and if you (and/or Keith) could go through them a last time and check that everything is as it should be that would be nice. I have one question concerning one of the refs in table 6.2: Does Bertrand et al., 2002b correspond to Bertrand, C., M.F. Loutre, M. Crucifix, and A. Berger, 2002b: Climate of the last millennium: a sensitivity study. Tellus Series a-Dynamic Meteorology and Oceanography, 54(3), 221-244.

Cheers,

Øyvind

Hi,

I've checked that the figures and captions are the final versions and they are all correct for figures 6.10-6.14.

I've also checked Box 6.4, Figure 1 and here there is an error with the caption. The caption ends with the reference period which currently states '...the period 800-1995.'

I got this wrong. The correct statement is "...the period 1001-1980."

Sorry about that (it was a mistake carried over from our earlier use of the figure from Osborn and Briffa, 2006, Science: for that paper we did use 800-1995).

Were you also after a check of the image quality? The figures I'm involved with all look pretty good, except that 6.10 is a bit blurry or lower quality. Was it inserted into Word in a different way to the others that might have degraded the image? Also, I wonder whether I should make the lines on Figure 6.10(b) and/or Figure 6.14(b) any thicker? Please let me know if you want me to do this.

Cheers

Tim

At 01:46 13/09/2006, Jonathan Overpeck wrote:

Hi all - We're editing main text, and we think we're close to the right length without having to make significant cuts beyond what you've seen already - it's mostly down to editing for consistent style and clarity. That's good news.

Øyvind recently sent (working very late over their) the attached figs and caption files (being sent in two files to keep each half under 10 Mb), and rather than Peck trying to figure out if it's all perfect, we're sending to YOU look at your figures and captions to make sure they are the most up-to-date versions. Thanks! It's a challenge to make sure we have all the most recent pieces, although we're betting that we're doing ok. Tomorrow (I hope - thanks Øyvind!) we'll send tables - hoping Tim, Keith, and Fortunat will be waiting to comment/edit if needed.

We're in much better shape than last cycles thanks to all your hard work - hope we can make this last bit easy for you. We appreciate you working fast when we send material.

Thanks, Peck and Eystein

Hi Gabi - we do loose quite a bit (e.g., boreholes and other proxies) back beyond 500, so that's why we drew the "very likely" line there. But, we did stay as strong as the TAR back 1300, so that was our compromise on certainty. I believe the forcing series also start to get more uncertain pretty fast back beyond even 400 years ago, but I'm pretty impressed with the match between simulated and observed NH climate back ca. 700 years (e.g., our Figs 6.13 and 6.14). Thus, I bet you are right that we know back to 700 pretty well, but not well enough to go with "very likely" in the all important chap 6 bullet.

Not sure this helps, but we do need to pay attention as we do the SPM to get the right balance.

I'll cc to Keith in case he wants to chime in, which would be appreciated.

thanks, peck

I asked Tom about it, he says (but I realize he is one sample of the volcano enthusiasts) it could have been El Chichon, the eruption seems to be huge, but there is concerns that different physics would apply to such a large eruption making it cause different climate impacts (he cites a paper for that that I promptly forgot). I am always slightly nervous about the fact that this one doesnt show up in the data, and wondering if there is a sliver of circularity, but I think results like my detection stuff and probably also EPOCH stuff (I could try) are quite robust to missing an eruption, even a biggie.

Greetings everybody!

Gabi

Subject: panel meeting and ice extent modelling
Date: Mon, 2 Oct 2006 10:46:26 +0100

<x-flowed>

Hi Tim

I've found some 'communicating cc' ref's which I've attached - nothing too hard going! Futerra's 'rules of the game' is a good intro to what climate change communicators should be working towards in terms of best practice. Sophie's poster is a summary of the main findings of her PhD research from a couple of years back in ENV, and is a message that some NGOs in particular would still do well to heed! Finally, the communicating CC document is an outline of Defra's recent initiative, as followed on from Futerra's consultancy work.

PhD stuff: at the last panel meeting, we agreed to meet again in early October. However, I think this meeting would best be delayed until we know exactly what info we can obtain for the expert elicitation as r.e. ice extent maps, time series etc.

I forwarded on the email from Xiangdong Zhang a few days ago - he's happy to give me some plots showing 2-D distribution of sea ice concentrations around 2050 and also animations from 1900-2100 under the A1B scenario.

How is the ice modelling going? Do you think you'd be able to get some plots say by w/c 9th Oct so we could talk about them in the meeting?

Cheers

Saffron

Subject: Re: VERY URGENT HELP NEEDED TO ADDRESS FINAL DRAFT PROBLEM

Date: Fri, 6 Oct 2006 09:11:04 -0600

Hi Keith and Eystein - thanks for the timely and helpful (very) feedback, Keith. Your suggestions for 4 and 5 seem fine, and I wonder only about 6. I too am not sure where the final clause came from, but I'll guess it was a suggestion of Stefan's that then stood the text of time. In the spirit of trying hard not to change the meaning of bullets in the ES from what the LA team agreed to in Bergen, what about changing this clause in the ES to read "natural recovery", i.e.:

and it is very unlikely that this warming was merely a natural recovery from the pre-20th century cold period."

This takes away the ambiguity, and does serve to address a widely held misconception outside of our community - or at least to phrase the issue in terms that some might find more useful.

If we keep this phrase, then I would suggest restating the entire ES sentence at the end of 6.6.3.

Is this ok? Again, I'm motivated by our team agreement - I do think we could delete this phrase since it's more repetitive than new meaning, but would rather not unless it really does not work. Personally, I like it as modified above, because it hammers the important point from a slightly different perspective - one that seems to be on the minds of the public still.

Thanks, both, for letting me know what you think fast.

best, peck

Hi Peck and Eystein

In response to Points 4-6

4. Add the following after past 1300 years. on line 13 page Y-33

"Considering the recent instrumental and longer proxy evidence together, it is very likely that average Northern Hemisphere temperatures during the second half of the 20th century were warmer than any other 50-year period in the last 500 years. "

Do not put anything in Box 6.4 which is written from the reverse perspective - evidence of medieval period not good enough to say warmer than now. Also confuses statements about 500 years and longer (1000 year) Medieval ,time.

5. The person who says this has not read the text - see lines 28-33 on Y-32 where I

think this is well covered.

6. If you read the text on lines 1-10 of PAGE Y-38 I think this meaning is clearly conveyed. It is not in the same words -but easily supports the ES statement.

HOWEVER, I do not like the last part of the statement (and not sure where this came from) because it is ambiguous and anyway implied by prior statement. I strongly urge you to remove the section

"and it is very unlikely that this warming was merely a recovery from the pre-20th century cold period."

These would sort things out I believe

cheers

Keith

At 19:26 05/10/2006, you wrote:

Hi Keith and Tim - we just got the attached consistency feedback doc from the TSU, and I've added my thoughts in red. We need your feedback on items 4-6 REALLY FAST. Tim, if Keith's not around to help, please do the job - the TSU has zero time to give us.

I think the solutions to #5 and 6 are easy as I suggested (although I don't have confirmation from Susan or Martin that we can just do as I suggest, but it seems logical to me - if you can suggest an even better solution, pls do.

I'll send the official chap 6 final draft text next - at least as it stands today.

thanks for dealing with this, perhaps before you go to sleep this evening.

Best, Peck

Keith,

I also figured this might be what you say, and I understand where you've coming from. This represents a bit of a dilemma too, as it seems unprofessional at best that Zorita and Von Storch have not made their code public, when we of course have made ours public.

There are other sources where we could have gotten the GKSS data--I'm checking w/ Caspar for confirmation. I know that the Cane group has it, and I believe other groups have it now too. So frankly, it is effectively now 'public domain' whether VS and Zorita like it or not!

I propose, hoping that there is no loud objection, that we will include a line in our response indicating that we have confirmed that we get similar results using the GKSS Erik simulation. We'll leave it at that. We don't need to show that result necessarily, unless the editor/reviewers demand to see proof, and we certainly don't have to reveal where we got the GKSS data. As I mentioned, there are enough groups out there that now have it, that VS and Zorita would not know the source, and we would not reveal it.

We feel as if we cannot completely hide the fact that we have confirmed our result w/ GKSS, hence the "compromise" suggested above. Meanwhile, we can pursue a more thorough, official collaborative effort in the future.

Thoughts on this?

thanks,

mike

At 17:33 10/10/2006, you wrote:

Dear Tim/Keith,

I hope all is well with both of you.

We've been doing a number of sensitivity tests w/ RegEM using both the CSM simulation, and now more recently the GKSS simulation data we got from you. There are some methodological developments we'll describe soon, related to what is the most reliable regularization method in RegEM, ridge regression and truncated total least squares. We are now leaning towards the latter because of potential non-convergence problems in some cases w/ the former. More on that soon.

More relevant, however, are the results. As you can see from the attached plot, RegEM works quite well w/ GKSS, using a short calibration period (1900-1980, corresponding to years 900-980 in the attached plot) and both white and red pseudoproxy noise (we used $\rho=0.5$ in the attached, but similar result for other values).

The most interesting result is that while RegEM reconstructs the full NH series well throughout, in the case of the CSM simulation, it does modestly underestimate the warmth of the earliest centuries in the GKSS Erik simulation (it fits everything else, including the LIA cooling, very well). We feel that this is likely due to problem of correctly identifying the 'drift' pattern using CFR methods.

The long and short of this is that we would like to be able to show this result in a (very short!) J. Climate response we need to finalize, to a comment on Mann et al (2005) J. Clim by Zorita and Von Storch. We would show you this response for comment of course, and would add you as co-authors. We have cleared with Andrew Weaver that this would be an acceptable course of action. We are hoping you are in agreement with this?
please let us know ASAP, we have to finalize our response within days.

thanks,

mike

Hi Keith,

Certainly not, and sorry for not clarifying. This is the response to the J. Climate comment by Von Storch that we're talking about here. The final draft is due this week, and so that's why I needed to check if you & Tim wanted co-authorship if we were going to show the GKSS result.

We can certainly plan to do a more detailed followup analysis jointly, I would very much enjoy that. Something we've talked about doing is a set of experiments with "mixed proxies" where the proxies have a variable combination of surface temperature and precip components--it will be very interesting to see what happens in these cases.

Perhaps this would be a good opportunity for collaboration, where we could apply this to several different models including CSM and the models you guys are working with?

let me know what you think.

thanks,

mike

This last point is likely true (though CO₂ began to rise earlier than the 1960s and the authors of the original paper believed that the high elevation (and concomitant low CO₂ partial pressure) may have amplified the response to small concentration changes. There is also the possibility that a synergistic increase in water-use (and possibly nitrogen use) efficiency could have contributed .

However, I agree that the rapid growth increase is most likely a result of a change in the proportion of net photosynthetic production potential (ie needle mass) relative to the area of living cambium that could occur as a tree shifts from "normal" to strip bark form .If this changes suddenly , as growth occurs only along a small strip rather than around the whole circumference (I know this is oversimplified) then you could easily get this apparent change in growth rate . BUT , if this is seen synchronously in many trees it would be hard to believe that this was the cause. To look at this would require a detail examination of all the data (in relation to the precise sample geometry) . Changing precipitation trends , such as occurred pre- and post the mid 1970s will also confuse things .

Thanks Jan and Rob also for this discussion.

Morning Martin,

It might be worth taking Keith's advice and contacting Malcolm Hughes.

I am not convinced that the Bunn study is fully relevant to addressing the use of BP data from Colorado and California as their study site is Montana. Malcolm gave a presentation earlier this year in Edinburgh which presented updated analyses on his BP work which played down the CO2 influence.

regards

Rob

Thanks for all those comments.

I'm trying to avoid omitting data on the basis of circumstantial evidence, even when it is presented enthusiastically. The Bunn et al. study is interesting (attached) because they show estimated dates of the onset of strip-bark growth. It looks to me as though the growth anomaly of the strip-bark trees relative to the others is more to do with this change than anything else. The onset of a positive growth anomaly in the 1850s is certainly too early to be associated with CO2 increases.

cheers,

Martin

Dear Dr. Jukes,

I'm afraid that, apart from the Bunn et al 2003 paper you mention, I know of no other recent literature or data directly relevant to this question. There is a graduate student here working on a dissertation related to this, but neither their data nor any publications on them are available at the moment. Two points concerning Graybill and Idso (1993):
1) I don't think the sour orange trees used in Sherwood Idso's experiments were stripbark - where did this idea come from? 2) When considering the use of upper forest border bristlecone pine (e.g. Sheep Mountain, Campito Mountain, and similar sites mainly above 3100m in the relevant region) as temperature proxies it would be a mistake to discount Figure 3 in Graybill and Idso (1993) which is a comparison of a

ufb bristlecone pine chronology with a smoothed gridpoint reconstruction from maximum latewood density in quite different trees provided by Keith Briffa, one of your co-authors. I read this graph as confirmation of LaMarche's interpretation of the ufb bcp records as having a ~bidecadal temperature signal combined with an interannual precipitation signal, at least before the 20th century. This is referred to Hughes and Funkhouser (2003).

I hope this helps, Malcolm Hughes

Malcolm

sorry , I should have cc'd this message sent to my coauthors some time ago(it pre-dates the message to you) , but I was sort of hoping this issue would recede . It would be useful to chat about this and other stuff if you are able to phone (afternoon my time preferably).

Cheers

Keith

Martin and all,

I know Franco very well - but he has not worked extensively with the Bristlecones. I still believe that it would be wise to involve Malcolm Hughes in this discussion - though I recognise the point of view that says we might like to appear (and be) independent of the original Mann, Bradley and Hughes team to avoid the appearance of collusion. In my opinion (as someone how has worked with the Bristlecone data hardly at all!) there are undoubtedly problems in their use that go beyond the strip bark problem (that I will come back to later).

The main one is an ambiguity in the nature and consistency of their sensitivity to temperature variations. It was widely believed some 2-3 decades ago, that high-elevation trees were PREDOMINANTLY responding to temperature and low elevation ones to available water supply (not always related in a simple way to measured precipitation) . However, response functions (ie sets of regression coefficients on monthly mean temperature and precipitation data derived using principal components regression applied to the tree-ring data) have always shown quite weak and temporally unstable associations between chronology and climate variations (for the high-elevations trees at least). The trouble is that these results are dominated by inter-annual (ie high-frequency) variations and apparent instability in the relationships is exacerbated by the shortness of the instrumental records that restrict analyses to short periods, and the large separation of the climate station records from the sites of the trees. Limited comparisons between tree-ring density data (which seem to display less ambiguous responses) imply that there is a reasonable decadal time scale association and so indicate a real temperature signal , on this time scale .The bottom line though is that these trees likely represent a mixed temperature and moisture-supply response that might

vary on longer timescales.

The discussion is further complicated by the fact that the first PC of "Western US" trees used in the Mann et al. analyses is derived from a mixture of species (not just Bristlecones) and they are quite varied in their characteristics , time span, and effective variance spectra . Many show low interannual variance and a long-term declining trend , up until about 1850 , when the Bristlecones (and others) show the remarkable increasing trend up until the end of the record. The earlier negative trend could be (partly or more significantly) a consequence of the LACK of detrending to allow for age effects in the measurements (ie standardisation) - the very early sections of relative high growth were removed in their analysis, but no explicit standardisation of the data was made to account for remaining slow width changes resulting from tree aging. This is also related to the "strip bark" problem , as these types of trees will have unpredictable trends as a consequence of aging and depending on the precise nature of each tree's structure .

Another serious issue to be considered relates to the fact that the PC1 time series in the Mann et al. analysis was adjusted to reduce the positive slope in the last 150 years (on the assumption - following an earlier paper by Lamarche et al. - that this increasing growth was evidence of carbon dioxide fertilization) , by differencing the data from another record produced by other workers in northern Alaska and Canada (which incidentally was standardised in a totally different way). This last adjustment obviously will have a large influence on the quantification of the link between these Western US trees and N.Hemisphere temperatures. At this point , it is fair to say that this adjustment was arbitrary and the link between Bristlecone pine growth and CO2 is , at the very least, arguable. Note that at least one author (Lisa Gaumlich) has stated that the recent growth of these trees could be temperature driven and not evidence of CO2 fertilisation.

The point of this message is to show that that this issue is complex , and I still believe the "Western US" series and its interpretation in terms of Hemispheric mean temperature is perhaps a "Pandora's box" that we might open at our peril!

What does Jan say about this - he is very acquainted with these issues?

cheers

Keith

At 15:01 15/11/2006, Martin Juckes wrote:

Hi,
Concerning Bristlecones, I had a sympathetic reply from Prof. North, but he deferred to the person who wrote the relevant paragraph in the NAS report (Franco Biondi) who is firmly of the view that strip-bark bristlecones should not be used. I've read a few of the articles cited to back up this statement and I am surprised by the extreme weakness of the evidence. There is one study of 27 strip-bark pines which shows that they clearly developed anomalous growth around 1850. Attributing this to CO2 is odd, to say the least. I'm writing a brief review of the literature which I'll send round in

a few days time.

cheers,

Martin

we still don't have an adequate explanation as to how Jack "cooked up" that figure - I do not believe it was purely out of thin air - look at the attached - which I used in the Crowley-Lowery composite just because it was "out there" - I made no claim that it was the record of record, but just that it had been used before. the Lamb ref. is his book dated 1966. I will have to dig up the page ref later. Dansgaard et al. 1975 Nature paper on Norsemen...etc used that figure when comparing what must have been their Camp Century record - have to check that too - where the main point of that paper was that the timing of Medieval warmth was different in Greenland and England!

25 years later my provocation for writing the CL paper came from a strong statement on the MWP by Claus Hammer that the canonical idea of the MWP being warmer than the present was correct and that the 1999 Mann et al was wrong. he kept going on like that I reminded him that he was a co-author on the 1975 paper! that is also what motivated to do my "bonehead" sampling of whatever was out there just to see what happened when you added them all together - the amazing result was that it looked pretty much like Mann et al. the rest is history -- much ignored and forgotten.

I might also point out that in a 1996 Consequences article I wrote - and that Fred Singer loves to cite -- Jack (who was the editor of the journal) basically shoehorned me into re-reproducing that figure even though I didn't like it - there was not an alternative. in the figure caption it has a similar one to Zielinski except that it states "compiled by R.S. Bradley and J.A. Eddy based on J.T. Houghton...so that puts a further twist on this because it point to Houghton not Bradley/Eddy as the source. Jack must have written that part of the figure caption because I don't think I knew those details.

but we still don't know where the details of the figure came from - the MWP is clearly more schematic than the LIA (actually the details about timing of the small wiggles in the LIA are pretty good) - maybe there was a meshing of the Greenland and the England records to do the MWP part - note that the English part gets cooler. they may also have thrown in the old LaMarche record - which I also have. maybe I can schlep something together using only those old three records.

Michael E. Mann wrote:

Ray, happy holidays and thanks for the (quite fascinating) background on this. It would be good material for a Realclimate article. would be even better if someone could get Chris on record confirming that this is indeed the history of this graphic...

mike

raymond s. bradley wrote:

I believe this graph originated in a (literally) grey piece of literature that Jack Eddy used to publish called "Earth Quest". It was designed for, and distributed to, high school teachers. In one issue, he had a fold-out that showed different timelines, Cenozoic, Quaternary, last 100ka, Holocene, last millennium, last century etc. The idea was to give non-specialists a perspective on the earth's climate history. I think this idea evolved from the old NRC publication edited by L. Gates, then further elaborated on by Tom Webb in the book I edited for UCAR, Global Changes of the Past. (This was an outcome of the wonderful Snowmass meeting Jack master-minded around 1990).

I may have inadvertently had a hand in this millennium graph! I recall getting a fax from Jack with a hand-drawn graph, that he asked me to review. Where he got his version from, I don't know. I think I scribbled out part of the line and amended it in some way, but have no recollection of exactly what I did to it. And whether he edited it further, I don't know. But as it was purely schematic (& appears to go through ~1950) perhaps it's not so bad. I note, however, that in the more colourful version of the much embellished graph that Stefan circulated ([1] http://www.politicallyincorrect.de/2006/11/klimakatastrophe_was_ist_wirkl_1.html) the end-point has been changed to 2000, which puts quite a different spin on things. They also seem to have fabricated a scale for the purported temperature changes. In any case, the graph has no objective basis whatsoever; it is purely a "visual guess" at what happened, like something we might sketch on a napkin at a party for some overly persistent inquisitor..... (so make sure you don't leave such things on the table...). What made the last millennium graph famous (notorious!) was that Chris Folland must have seen it and reproduced it in the 1995 IPCC chapter he was editing. I don't think he gave a citation and it thus appeared to have the imprimatur of the IPCC. Having submitted a great deal of text for that chapter, I remember being really pissed off that Chris essentially ignored all the input, and wrote his own version of the paleoclimate record in that volume.

There are other examples of how Jack Eddy's grey literature publication was misused. In a paper in Science by Zielinski et al. (1994) [v.264, p.448-452]--attached-- they reproduced (in Figure 1c) a similarly schematic version of Holocene temperatures giving the following citation, "Taken from J. A. Eddy and R. S. Bradley, Earth-quest 5 (insert) (1991), as modified from J. T. Houghton, G. J. Jenkins, J. J. Ephraums, Climate Change, The IPCC Scientific Assessment (Cambridge Univ. Press, Cambridge, 1990)."

But I had nothing to do with that one!

So, that's how a crude fax from Jack Eddy became the definitive IPCC record on the last millennium!

Happy New Year to everyone

for those who are interested, there is a paper by Gosse et al (I'm a co-author) explaining why parts of Europe such as central England would have experienced warmer summer conditions relative to present than other regions, related to early land-use change:
Gosse, H., Arzel, O., Luterbacher, J., Mann, M.E., Renssen, H., Riedwyl, N., Timmermann, A., Xoplaki, E., Wanner, H., [1]The origin of the European "Medieval Warm Period", Climate of the Past, 2, 99-113, 2006.

paper available as pdf here:
[2]<http://www.meteo.psu.edu/~mann/shared/articles/Gooseetal-CP06.pdf>
meanwhile, winter warmth could have been due to a strong AO/NAO pattern associated with decreased volcanism and high solar, as discussed in the various Shindell et al paper. this simply underscores the point that we all often make, that one needs to take into account regional factors when interpreting regional records. This is especially relevant to the extrapolation of a long record from England to the entire NH (which appears to have been tacitly done by Jack Eddy?),

sounds good Phil, I agree on the forecast. I think its at least 'plausible' ;)

by the way, please remind me what input you need from me at this point on the Wengen paper. I've attached a review paper I've got in press in "AREPS". Not sure if I sent this to you before. Its mostly a re-tread of our '04 Rev Geophys review (which is getting lots of citations if you've noticed!), but a little bit of newer stuff.

talk to you later,

mike

Ah, you mean A9(d) (I thought you meant A9(a) for a bit). Yes, that looks pretty similar to IPCC 1990. Though not identical - the scaling is different, but the timing is similar.

Greetings,

I have now heard back from all of you and the only date that will work for all of you will be Monday, 8 January (that's Tuesday, 9 January for Nathan & Zhenlin). A small adjustment to the time would be necessary to accommodate all of you. To ensure that we would have enough time for everyone to participate in the entire call we would need to start 30 minutes earlier. So, that would be 12:30 MST/19:30 UTC. I am going to hope that is ok and move forward with establishing the call. Please let me know ASAP if that time adjustment will NOT work for you. You will receive another email from me shortly with the details. Please also let me know if the following contact information changes for you.

| | |
|--------------------|------------------|
| Susan Solomon | +1 303 497 3483 |
| Martin Manning | +1 303 497 4479 |
| Nathan Bindoff | +61 3 62262986 |
| Kevin Trenberth | +1 303 497 1318 |
| Matilde Rusticucci | +54 11 4797 4672 |
| Phil Jones | +44 1953 605643 |
| Brian Hoskins | +44 118 98411308 |
| Peter Lemke | +49 5193 1458 |
| Jurgен Willebrand | +49 431 688475 |
| Zhenlin Chen | + 86 10 68406146 |

Cheers,

Melinda

Melinda Tignor wrote:

Greetings,

I am contacting you to schedule the upcoming teleconference. Due to the extreme variability in your time zones this will likely be a bit tricky and outside "normal" business hours for some of you.

Please let me know as soon as possible your availability for the following times for the

week of 8 Jan - 12 Jan:

Nathan - 7:00 (Hobart)

Kevin - 13:00 (MST)

Matilde - 17:00 (Buenos Aires)

Phil, Brian - 20:00 (UK)

Peter, Jurgен - 21:00 (Germany)

Again, I realize that some of you would be most likely taking this call from home due to

the early or late time.

Many thanks in advance for your prompt response.

Cheers,

Melinda

Dear All,

I've added a few extra names in the cc of this email list to see if we can

definitively determine where the figure in the subject title comes from. The

background is that the skeptics keep referring back to it and I'd like

to prove that it is a schematic and it isn't based on real data, but on

presumed knowledge at some point around the late 1980s. If you think it is based on something real.

What we'd like to do is show this either on 'Real Climate' or as background

in a future paper, or both.

I'm attaching a few diagrams as background (attaching in order of

introducing them) and giving some earlier thoughts. I assume you all have

a copy of the said diagram in the first IPCC report.

1. This is where the IPCC diagram came from - the top panel is also there, but the middle one from IPCC isn't. This is where Chris Folland

knows it came from. He said it was shoehorned in at a very late date.

This report comes from a UK Dept of the Environment document - where the

first edition predates 1990. David Warrilow says that this was written by

Geoff Jenkins and John Mitchell.

John said the following

I think it was based on a diagram A2 in the national Academy of Sciences

bullet "Understanding climate change" circa 1974 if rmeber correctly- I

can find out in Reading tomorrow- which I can't find in the library- it

was reproduced in one of John Gribbens books and I think a book called the "1982 CO2 review". I think there 6 diagrams and I remember Tom Wigley commenting that only the first (millions of years) and Last (instrumental record) had any credibility.

and

National Research Council, US Committee for the Global Atmospheric Research Program, Understanding Climatic Change: A Program for Action, National Academy of Sciences, Washington, DC, (1975), appendix A.

2. This 1975 book has the 3rd attachment on p130 . This is very similar to one

that David Warrilow said (also attached from Imbrie and Imbrie - second

attachment).

from David

I can't be sure but I think the original diagram is from Imbrie and Imbrie :

Imbrie, John and Katherine Palmer Imbrie. Ice ages: Solving the Mystery. Cambridge,

Massachusetts: Harvard University Press, 1979, 1986 (reprint). ISBN 0-89490-020-X; ISBN

0-89490-015-3; ISBN 0-674-44075-7. p. 25

These look the same if you invert and rotate the one from 1975, and they both

say 'winter conditions in Eastern Europe' - well Imbrie/Imbrie do. They

also say adapted from Lamb (1969). This is the World Survey of Climatology

series from Landsberg, vol2. I've been through this and I can't see much

of a plot anything like those I've attached, so some adaptation. Also I've

no idea what this Eastern European series is!

The IPCC diagram and the UK report clearly don't originate here.

3. Caspar Amman had John Gribbin's 1982 book and sent the 4th attachment. This has a warmer MWP, but is far too cool recently.

So even if this was resmoothed, it wouldn't be before the IPCC one.

4. Ray Bradley sent this text:

I believe this graph originated in a (literally) grey piece of literature that Jack Eddy

used to publish called "Earth Quest". It was designed for, and distributed to, high school

teachers. In one issue, he had a fold-out that showed different timelines, Cenozoic,

Quaternary, last 100ka, Holocene, last millennium, last century etc. The idea was to give

non-specialists a perspective on the earth's climate history. I think this idea evolved

from the old NRC publication edited by L. Gates, then further elaborated on by Tom Webb in

the book I edited for UCAR, Global Changes of the Past. (This was an outcome of the

wonderful Snowmass meeting Jack master-minded around 1990).

I may have inadvertently had a hand in this millennium graph! I recall getting a fax from

Jack with a hand-drawn graph, that he asked me to review. Where he got his version from, I don't know. I think I scribbled out part of the line and amended it in some way, but have no recollection of exactly what I did to it. And whether he edited it further, I don't know. But as it was purely schematic (& appears to go through ~1950) perhaps it's not so bad. I note, however, that in the more colourful version of the much embellished graph that Stefan circulated (

[1]http://www.politicallyincorrect.de/2006/11/klimakatastrophe_was_ist_wirklich.html

the end-point has been changed to 2000, which puts quite a different spin on things. They

also seem to have fabricated a scale for the purported temperature changes. In any case,

the graph has no objective basis whatsoever; it is purely a "visual guess" at what

happened, like something we might sketch on a napkin at a party for some overly persistent

inquisitor..... (so make sure you don't leave such things on the table...).

What made the last millennium graph famous (notorious!) was that Chris Folland must have

seen it and reproduced it in the 1995 IPCC chapter he was editing. I don't think he gave a

citation and it thus appeared to have the imprimatur of the IPCC.

Having submitted a great

deal of text for that chapter, I remember being really pissed off that Chris essentially

ignored all the input, and wrote his own version of the paleoclimate record in that volume.

There are other examples of how Jack Eddy's grey literature publication was misused. In a

paper in Science by Zielinski et al. (1994) [v.264, p.448-452]-- attached-- they reproduced

[in Figure 1c] a similarly schematic version of Holocene temperatures giving the following

citation, "Taken from J. A. Eddy and R. S. Bradley, Earth-quest 5 (insert) (1991), as

modified from J. T. Houghton, G. J. Jenkins, J. J. Ephraums, Climate Change, The IPCC

Scientific Assessment (Cambridge Univ. Press, Cambridge, 1990)."

But I had nothing to do with that one!

So, that's how a crude fax from Jack Eddy became the definitive IPCC record on the last

millennium!

5. Finally, here's one from Stefan, to show how the IPCC diagram gets (first another one which appears to be the IPCC 1990 diagram).

The one I want to attach seems to be within Stefan's email so that

is the end of this email. You can also get to this by going to the link

in Ray's piece above.

It shows how you can embellish a diagram and even get Rembrandt in!

I've also seen many other embellishments mentioning Greenland, the Vikings,

Vineyards in York, frost fairs on the Thames etc. Also I've emailed over

the years for the numbers in the 1990 IPCC Figure. I even got a digitized

version once from Richard Tol and told him what he'd done was ludicrous.

6. So who put it together? Do we blame Ray? Is it a whim of his excellent imagination? I know we will all likely agree with Ray that it is based on absolutely nothing. Tom Crowley thinks it might be based on Lamb and sent the final figure. Now all of those who are or were in CRU know, you should be very careful with Lamb diagrams! This one does not stand any scrutiny and there are several more recent papers by Tom Wigley, Astrid Ogilvie and Graham Farmer that have shown that this final diagram is irreproducible and it was much cooler in the 11-13th centuries. It is also England and summer only. The galling thing is, it does look like the IPCC Figure!!!!!! When Tom sent the figure, he added this text (see below).

The figure looks like Figure 30 (I've not scanned this one), but will,

from his 1982 (reprinted in 1985 and 1995) called Climate History and the Modern World. This figure has series for the year, JJA and DJF.

Someone tell me it isn't based on a Lamb diagram, please....

Phil

Tom Crowley said

we still don't have an adequate explanation as to how Jack "cooked up" that figure - I do

not believe it was purely out of thin air - look at the attached - which I used in the

Crowley-Lowery composite just because it was "out there" - I made no claim that it was the

record of record, but just that it had been used before. the Lamb ref. is his book dated

1966. I will have to dig up the page ref later. Dansgaard et al. 1975 Nature paper on

Norsemen...etc used that figure when comparing what must have been their Camp Century

record - have to check that too - where the main point of that paper was that the timing of

Medieval warmth was different in Greenland and England!

25 years later my provocation for writing the CL paper came from a strong statement on the

MWP by Claus Hammer that the canonical idea of the MWP being warmer than the present was

correct and that the 1999 Mann et al was wrong. he kept going on like that I reminded him

that he was a co-author on the 1975 paper! that is also what motivated to do my "bonehead"

sampling of whatever was out there just to see what happened when you added them all together - the amazing result was that it looked pretty much like Mann et al. the rest is history -- much ignored and forgotten.

I might also point out that in a 1996 Consequences article I wrote - and that Fred Singer loves to cite -- Jack (who was the editor of the journal) basically shoehorned me into re-reproducing that figure even though I didn't like it - there was not an alternative. in the figure caption it has a similar one to Zielinski except that it states "compiled by R.S. Bradley and J.A. Eddy based on J.T. Houghton....so that puts a further twist on this because it point to Houghton not Bradley/Eddy as the source. Jack must have written that part of the figure caption because I don't think I knew those details. but we still don't know where the details of the figure came from - the MWP is clearly more schematic than the LIA (actually the details about timing of the small wiggles in the LIA are pretty good) - maybe there was a meshing of the Greenland and the England records to do the MWP part - note that the English part gets cooler. they may also have thrown in the old LaMarche record - which I also have. maybe I can schlep something together using only those old three records.

tom
Stefan said
the reason why I started to worry about this is the attached graph. Recognise something?

- Used in school teaching in Germany, Austria and Switzerland, is on a website with officially recommended teacher materials
- Used in university teaching in Germany
- Used in politics in Germany by people within the FDP.

Note the vertical axis label on that, by the way. The text that goes with it claims the medieval warm period was 2-4 °C warmer than today. Climate sceptics material, of course.

Cheers, Stefan

I think that this story could possible catch on and make headlines, so I agree that we should be careful. But it's important that we bring the *true* picture out, and it is best that this is done by RealClimate rather than a sceptic site. The general scientific side of the IPCC report (i.e. all the peer-reviewed papers and the scientific theories) is still sound, but to explain how *one* figure was shoe-horned into the report is harder to defend. The sceptics may argue that the IPCC reports are political after all, and this is also what it sounds like if governments 'hoisted the national flag' by having it's own figures inserted last minute. However, by providing an account of the 'evolution of the IPCC report writing', we could possibly give the story a softer landing. E.g. how many times of review the first report underwent as compared to the present report. We should also put this in perspective - the report is large and covers a wide range of topics, and most (all but our case?) is true to the science. There are sometimes a few rotten apples in a good batch, unfortunately. But the important part is that we don't accept rotten apples and that we sort it out! Forthcoming and up-front. Another important side is that this can provide a lesson for the scientific communities.

One too many 0's. 0.005.

Kevin

Susan Solomon wrote:

Phil,

Thanks. This comes up both in the presentation and in SPM language.

A suggested merge of Phil's text below with the SPM language we have implies replacing the sentence on page SPM-5, 6-7 with the following proposal:

Sites affected by the urban heat island effect are identified and excluded from these averages, so that remaining uncertainties due to this effect are negligible (less than 0.0005°C per decade).

This would address several comments asking us to explain what is done with UHI.

OK?

Susan

At 3:52 PM +0000 1/8/07, Phil Jones wrote:

Kevin, Susan,

On the UHI (slide 9) we should probably change the middle bullet. The first and third are not in dispute. May be better to spell out SSTs though, or say marine air temperatures. SSTs are used as anomalies though to approximate MATs.

Middle bullet currently says

o Major influences are identified and excluded from the records used to create the continental and global values

Perhaps we should refer directly to David Parker's paper on UHIs, where he couldn't detect any difference in trends (averaged for 200+ cities) in temperatures on calm nights (when you'd expect the biggest effect) compared to windy nights (when you'd expect the least).

There are two aspects to the major influences.

1. Some sites are removed. This isn't many as a % of the total (about 1%).
2. We include in Brohan et al (2006) an estimate of urbanization in the calculation of the errors. This is 0.0055 deg C/decade since 1900. It is a one-sided 'error'. If you look very closely the error range in this paper and in some of the Ch 3 figures is slightly one-sided. This figure comes from Jones et al. (2001) , which came from Jones et al. (1990).

Difficulty with all UHI work is that there are countless papers looking at individual sites - which generally use a site in the city centre. This site is rarely one used in the dataset - generally an airport is instead. It is made worse by then looking at individual days and not monthly averages. Only Jones et al. (1990), Parker (2005,2006) and Peterson have looked at large scales.

So

Affected site are identified and excluded from the records used to create the continental and global values (as not all sites are tested, part of the error range assumes an urban component of 0.0055 deg C/decade)

Cheers

Phil

Many thanks for the feedback. My comments and explanations follow. I'll expressly ask Phil to respond to us on the UHI issues and what we should say succinctly. I am keen to get further feedback on what to exclude. I had decided to exclude the full slide on all the regional precip trends because it is too detailed and would take too long to go through and so the zonal mean latitude-time series captures a lot of the changes. Personally I would like to have both but the issue will be time and simplicity of message, and hence my decision to drop the series: implicitly those are included of course because they are in the chapter.

Yes slide 1 at present is more comprehensive and perhaps more appropriate for you to use. In general with these slides that context will be desirable but perhaps not for Paris.

I understand: indeed we did not expressly say "dimming" but in the discussion of dimming it clearly relates to clouds and aerosol. My thinking here is that some may well be aware of dimming but not of changes in clouds, so I thought that terminology might be helpful rather than add confusion. Other views appreciated.

> in laying ground for that.

Heavy precip is confusing, because some analysis are in absolute terms: and others are in terms of the percentage of precip that is heavy. The

latter change is much more universal, and the main exceptions are where precip amounts have decreased, implying a drier regional climate. Since our report there is anew report in Science on extremes in India in the monsoon increasing and there they talk about real extremes. In the slide we already say "proportion of heavy rainfalls are increasing" so the suggestion is to add "most land areas"? OK.

- > one on pdsi could be dropped.

Slide 20 is from Dai et al 2004. It is extensively discussed in the full report in section 3.3.4 and was featured in some email discussions for the TS related to the trend in the previous slide, resulting in some refinement of the FAQ 3.2. Whereas slide 19 is for all of PDSI, slide 20 separates out PDSI above and below a threshold of 3 and -3 and takes it apart to examine the precip and temperature contributions. It is quite complementary in that regard and shows more explicitly that it is the dry spells that increased first from precip decreases and second from temperature effects.

- > substantially different from the published one
- > that is assessed.

No that is not true. In our discussion in section 3.8.3 we note that the original Emanuel (2005a) set of curves was revised and discussed in Emanuel (2005b) in response to the comment by Landsea. But that response did not publish the revised curve; instead it appeared on Emanuel's website. It was that curve we discuss in the report (and the main reason we did not show it was because it had changed) and we say "the PDI increasing by about 75% (versus about 100%) since the 1970s (Emanuel 2005b)." The 100% was the original finding. Now there is a further minor refinement in the 2007 paper (in response to further complaints by Landsea, the corrections to the record to make the surface p and wind estimates compatible was not done at the highest wind speeds: very small changes) but an advantage is

that it is updated to include more years: through 2005. It is standard practice for obs time series to be updated and that is mainly what the new curve does. It is not at all at odds with what we discuss already.

The SST curve though is for N Atlantic only and the Webster stuff is global.

We could replace the ACE curve with the numbers curve from slide 28?

With these explanations, I look forward to further suggestions.

- > to help back it up more broadly, that will help
- > to avoid challenges (please see the comments).

I included slide 22 which shows the shift in distribution of hot days and cold nights, and I thought this might be better than the Alexander et al maps. Again we run into too many slides. The change in hot days of course relates to heat waves, because the change in extremes relates to the whole pdf. The term heat waves is very subjective and the time scale is not always clear. There was a heat wave on east coast (New York 71F yesterday) although part of a month long warm period. The other main discussion of heat waves in our text is for Australia and I took out the slide of Australia temperatures vs precipitation in the first version (that Brian and Matilde have not seen). There is not much we can do here. The preponderance of evidence from all the statistics and studies demonstrates a clear increase in heat waves, even if there is not a definitive study just on heat waves. That is what we have to say.

Regards

Kevin

Dear All,

Agree with Brian's new bullet. I still think we will get comments about what changes with storms. If this is going to lead somewhere we don't want it and cause problems, then the final part is likely best removed.

Reading it again, better if we say .. since the 1960s. About is a little vague.

Back in CRU on Friday. I may be able to get this hotel link to work tomorrow morning.

Cheers
Phil

Reply-to: mann@psu.edu
Cc: raymond s bradley <rbradley@geo.umass.edu>

thanks Phil,

not suggestion you not cite Wegman report, just suggesting you make sure the citation makes clear what the report is...

mike

p.s. where/when did Tom Crowley use it?

Phil Jones wrote:

Mike,

Thanks.

On 1) Putting the last few years in zooms the CET curve much higher.

Tim took out the last few years. I need to make this clearer in the caption.

Padding is an issue with a 50-year smoother.

2) I agree Wegman isn't a formal publication. This was the highest profile example I could come up to show abuse of the curve. if you know of any others then let me know.

Even Tom Crowley shouldn't have used it. There is a belief in the UK, that a curve of UK/CET past temperatures (by summer and winter) exists. It doesn't, but the winter curve from Lamb is probably a lot better than the summer one.

I'll let you know on time-frame when I hear from a few more I've sent the piece to.

Cheers

Phil

At 14:10 15/01/2007, Michael E. Mann wrote:

Phil,

The attached piece is very good, impressive in the detail you've been able to dig up on this. Won't pass this along.

A couple minor comments:

1. I understand the point of the 50 year smoothing, but I think it would still be very useful to show were the most recent decade is on this scale. a lot of the recent warming is washed out by the padding at the end. People will look at this and say "see medieval peak was warmer than present". but that doesn't follow because so much of the warming has been over past two decades.

2. I would not reference Wegman report as if it is a publication, i.e. a legitimate

piece of scientific literature. Its a piece of something else! It should be cited in such a way as to indicate it is not a formal publication, wasn't peer-reviewed, i.e. could be references as a "criticism commissioned by Joe Barton (R, Exxon).

3. I think that Stefan/Gavin were hoping to do something on RC sooner than the timeline you mention. What do you think about this? Do you want to forward the message to them and tell them the timeline you have in mind?

talk to you later,

mike

p.s. thanks very much for the 'nomination' :), but you flatter me. I think that someone farther along in their career such as Keith is more deserving at this time.

Phil Jones wrote:

Ray,

I have been nominating you for several years, as has Andre and Jean - I think. Not sure how much the last two have been involved recently. I haven't been for a few years.

So, congratulations ! If as in previous years, you get asked about future awards, then consider nominating Keith and/or Mike. In the past it has alternated between ice cores and others.

As for a presentation, something on the lines of where we stand etc. will be great.

Gerard seems to be very flexible with the date for CL28. I've no idea how many abstracts there are yet. Haven't done anything on publicity for the session. Later in the week I'll check how many we have. So suggest the session day you want. Avoid Friday - people leave, also a bit on Thursday. Tuesday and Weds tend to have the most people there. I'll likely put you first in a session - not the early morning, but after coffee or lunch. I'll liaise with Gerard. I have to organize everything by next Monday as I'm at the IPCC in Paris from Jan 23 till Feb 2.

Can you two give me your thoughts on the attached? I think this is best in the Wengen meeting summary. Certainly after IPCC has met and likely after June when the chapters come out. Don't pass on to anyone and don't use in Vienna.

Cheers

Phil

PS Are you two getting loads of press cuttings from Mike Schlesinger?

At 18:25 13/01/2007, Michael E. Mann wrote:

Ray, I hadn't heard the announcement. This is wonderful news. You (like Phil) couldn't be more deserving for this.

I'm sorry that I won't be there (EGU comes at a bad time of the Penn State semester). I owe you a drink when next we meet.

Congratulations again!

mike

raymond s bradley wrote:

I was totally surprised to learn I was selected for the EGU's Oeschger medal this year--so if you had anything to do with that, many, many thanks. I knew Hans quite well and so this is especially meaningful for me. Phil got the first Oeschger Medal so I know I am following in his big shoes. But I can't help feeling it's all a clerical error somehow and a correction letter will appear any day now....

But, assuming this is not so...I was asked to give a talk aimed at a non-specialist audience in one of the sessions. I think your session on the last millennium is the obvious session in which to do this, so I will prepare something along the lines of "climate of the last millennium: status and prospect" so I can briefly summarise where we are at and what seems to be needed.

I'll submit an abstract on-line this weekend.

Phil,

I've seen this junk already. Look at the co-authors! DeFrietas, Bob Carter: a couple of frauds. I dont' think anyone will take this seriously...

Do you have any advance knowledge you could pass along that would help us gear up to do something on RealClimate? I assume that there will be no surprises in the paleoclimate chapter, but I haven't seen the final draft. Any hints you can drop would be great...

thanks,

mike

Susan

This is very clear and very useful Thanks

Keith

At 15:21 19/01/2007, Susan Solomon wrote:

Keith, Peter, Isaac, Ron,

Thanks to all of you for helping out.

Keith, the audience for the presentations is the policy makers who will be present in Paris. As you have already seen from the comments, many of them are not scientists. The presentations need to be pitched at a non-scientist level. A number of the policy people will be lawyers, and a number will be legalistically looking to find anything that can advance their position. Most of them will however just be looking to ask questions and to better understand, and many will be constructive in how they use the information provided. So it is quite a mix. They should not be given input that distracts from the job at hand. Therefore, these presentations should not bring in new issues not raised in the comments, figures from material outside the report, etc.

I hasten to say that all of us hope there will not be big problems in going through the presentations. The presentations are being carefully prepared by excellent people, so my expectation would be for quite minor changes.

All of the above has been discussed with those preparing the presentations, so a primary role in co-chairing this session is to lend a constructively critical eye, seeking to advance the goal of clarity, conciseness, and sticking to the report rather than straying, if needed. The outcome is not a formal approval statement of the presentation. The outcome is to guide the collective subgroup to a *clear* consensus on what should be changed before the presentation is passed in to the TSU. If there are things that a majority of the group wants to see changed but others do not, you will have a chairman's job to do in finding a solution everyone can live with. It would probably be helpful if you could keep some notes on the agreed changes, since that will help you ensure that you have been clear enough in stating the conclusion. Too often there is a thrash and no closure. A good chair gets agreement with the group.

Thanks again,

Susan

At 1:00 PM +0000 1/19/07, Keith Briffa wrote:

Hi Susan et al

sorry for delayed response - just back from Paris (or so I originally thought as the meeting I was at turned out to be 3 hours away by train). I too am happy to act as you request, though I am still uncertain as to who the specific audience will be and more particularly, what you expect as an outcome of the session (a formal approval statement or recommendation for amendments?).

cheers

Keith

At 00:31 18/01/2007, Susan Solomon wrote:

Dear Peter, Isaac, Ron, and Keith

I am writing to let you know that the agenda for our C/LA meeting to take place in Paris on Saturday and Sunday Jan 27/28 will have your names listed for a proposed role, and I hope you will be able to accept.

At the end of the second day of the meeting, we will go over the set of longer 'science presentations' that will be given informally during the lunchtime sessions. There will

be two parallel sessions from 4-6 pm on Sunday, and I am hoping that Peter/Keith can chair one dealing with drivers, obs, and paleo, while Ron and Isaac can chair one on attribution/sea level/projections.

Earlier on Sat/Sun we will also have gone over the shorter formal presentations that will be used to start each section of the SPM during the meeting.

See below for some more information CLAs requested for preparation of the shorter presentations.

An important point is that the short and long presentations should be consistent and should strongly support the SPM approval process (see below).

We are seeking tough chairmen who could a) keep to a strict time schedule and avoid slippage; b) ensure that a clear statement is made about what the group conclusion is (e.g., if the group feels that a particular presentation should be changed, that needs to be made clear to the person who will hand in the final presentation to the TSU); and c) helps the group to focus on the need for these presentations to communicate with policy people (not overly technical) and help address the comments received (not to digress). In short, to be tough, fair, constructive, and well organized.

Thanks in advance for considering helping with this. If you feel you cannot do it, let me know but I will assume silence is agreement to serve.

best regards,

Susan

X-DPOP: Version number suppressed

Dear CLAs,

We are writing to address the two types of presentations (shorter and longer) that are to be given in Paris. A number of you have asked about the shorter presentations in particular and we want to clarify that here.

We would like to ask the people who served as section coordinators for each section in our TS/SPM meetings to coordinate pulling together the shorter presentations of not more than 10 slides (Ramaswamy on drivers; Bindoff on observations; Hegerl on attribution, Stocker on projections).

Many of you have kindly already sent around draft material for the longer science presentations, and that has been very helpful. These will occur informally during lunch breaks, or before the morning sessions at the plenary and will not be subject to simultaneous translation. The most interested delegates will typically find these very helpful, and will want to use them to ask you questions.

In addition, during the regular formal sessions and prior to presentation of each of the major sections of the report (drivers, observations, attribution, and projections), we will benefit from a very short presentation that introduces the section. The speaker's words will be subject to simultaneous translation. We suggest that the paleo ice core material be covered as part of the drivers, that the paleo observations be covered as

part of the observations, etc, to speed things up (we can switch speakers but keep slides in the same file).

These shorter presentations are extremely important in setting the stage. They must be very short. We will have an absolute limit of not more than 10 minutes, preferably 5 minutes for the shorter sections of the report namely drivers and attribution). Please do not include more than a maximum of 10 slides. Questions will be strictly limited by the session chair (Susan or Dahe) to matters of clarity (e.g., if an axis isn't clear). We will go over both the shorter and the longer presentations jointly at our preparatory meeting at the UNESCO center on Sat/Sun Jan 27/28 so please come prepared to do that. An agenda for the preparatory meeting will be circulated to you shortly.

The shorter presentations can largely be derived from the longer ones. They will be most helpful if:

- they do seek to provide a general sense of how the section is meant to fit together and some key highlights.
 - they present the figures and tables used in the SPM section to follow, but do not include figures from the chapters unless absolutely essential. Including figures from outside the report could create problems and should be avoided.
 - they avoid raising new issues or suggesting changes from the distributed SPM.
- As some of us have seen in the heated discussions via email about the MOC, sticking to the agreed consensus obtained in the chapter teams is something our colleagues who will not be in Paris would appreciate our doing as much as possible. We will need to agree to all changes to be presented by us to delegates as a team in our preparatory meeting on Jan 27-28. They will choose to seek more and that is what we will have to jointly manage.
- they have very little text on them, as simple as possible.
 - they do not try to cover each bullet.

You may wish to consider whether it is helpful to alternate speakers between your science presentation and these short presentations, so that more of you get a chance to speak.

Some of you asked for sample presentations. You are probably aware that we completed a special report on HFCs/ozone in 2005. The short presentation on our section (section 2) at that session worked extremely well and is appended here as an example in case you want to glance at it, along with the SPM itself. We had much less material to cover of course and more time to do it (this is more than 10 slides but don't be tempted as that was a different situation) but we hope this is still helpful.

We look forward to seeing you and discussing all of the presentations on Jan 27-28.

Best regards,

Susan, Martin, and Dahe

Ok that explains several things, I am so glad to know this before going to Paris tomorrow. I made another minor tweak.

Curt, I can't believe the nonsense you are spouting, and I furthermore cannot imagine why you would be so presumptuous as to entrain me into an exchange with these charlatans. What is earth are you thinking? You're not even remotely correct in your reading of the report, first of all. The AR4 came to stronger conclusions than IPCC(2001) on the paleoclimate conclusions, finding that the recent warmth is likely anomalous in the last 1300 years, not just the last 1000 years. The AR4 SPM very much backed up the key findings of the TAR. The Jones et al reconstruction which you refer to actually looks very much like ours, and the statement about more variability referred to the 3 reconstructions (Jones et al, Mann et al, Briffa et al) shown in the TAR, not just Mann et al. The statement also does not commit to whether or not those that show more variability are correct or not. Some of those that do (for example, Moberg et al and Esper et al) show no similarity to each other. I find it terribly irresponsible for you to be sending messages like this to Singer and Monckton. You are speaking from ignorance here, and you must further know how your statements are going to be used. You could have sought some feedback from others who would have told you that you are speaking out of your depth on this. By instead simply blurring all of this nonsense out in an email to these sorts of charlatans you've done some irreversible damage. Shame on you for such irresponsible behavior! Now that the latest IPCC WG1 SPM is published, I can venture more opinions on the above-referenced subjects.

It is indeed striking that IPCC's estimate of maximum plausible 21st century sea-level rise has decreased over time. The latest estimate is 0.5 meters for the A2 emissions scenario (not much higher from the 0.4 meter estimate for the A1B emissions scenario, which the Wall Street Journal editorial page has made much of). On the other hand, the IPCC seems to have taken a pass on Hansen's argument. The IPCC says their estimates are "excluding future rapid dynamical changes in ice flow . . . because a basis in published literature is lacking."

In this one respect (sea level rise) I agree with today's Journal editorial that the science is not yet settled. Unfortunately, the editorial runs completely off the tracks thereafter by (1) comparing 2006 vs. 2001 surface temperatures, among all the 150 or so years on record, and (2) asserting a "significant cooling the oceans have undergone since 2003" based apparently on one published data-set that contradicts all the others. It is not appropriate to cherry-pick data points this way. It's like trying to figure out long-term trends in the stock market by comparing today's value of the Dow with last Tuesday's value.

Re high-resolution paleodata, I never liked it that the 2001 IPCC report pictured Mann's without showing alternates. Phil's Jones' data was also available at the time. Focusing so exclusively on Mann was unfair in particular to Mann himself, who thereby became the sole target of criticism in the Wall Street Journal etc.

It now seems clear from looking at all the different analyses (e.g. as summarized in last year's NRC review by North et al.) that Mann is an outlier though not egregiously so. Of course, like any good scientist Mann argues that his methods get you closer to the truth than anyone else. But the bottom line for me is simply that all the different studies find that the rate of warming over the last 50-100 years is unusually high compared with previous centuries.

Summarizing all this, the latest IPCC does back off a bit from the previous one. It says on Page 8, "Some recent studies indicate greater variability [than Mann] in [pre-industrial] Northern Hemisphere temperatures than suggested in the TAR . . ." The wording is perhaps insufficiently apologetic, but I find it hard to object strenuously to it in light of the main point noted in the last paragraph.

If you want to discuss any of this further, let me know. I attach my latest presentation -- and would appreciate seeing both Christopher's report mentioned in the Journal editorial and Fred's comment on Rahmstorf's article published in Science last week.

Best regards,
Curt

Christopher Monckton <monckton@mail.com> wrote:

Dear Mr. Covey - Many thanks for coming back to me so quickly. You mention Hansen's recent

papers. I have recently been looking at an (attached) earlier projection of his - the projection of temperature increase which he made to the US Congress in 1988, effectively starting the "global-warming" scare. Updating his graph shows that annual global mean land and sea surface air temperature is not rising anything like as fast as his attention-grabbing but now manifestly-misconceived Scenario A suggested. Indeed, it is beginning to look as though temperature is beginning to fall below his estimate based on CO2 having been stabilized in 1988. Morner, the world's leading authority on sea level, has been very clear in saying there is very little evidence to justify the IPCC's sea-level projections. The IPCC itself forecast up to 0.94m sea level rise in a century in its 1996 report; up to 0.88m in its 2001 report; and now 0.43m in its 2007 report. If one loosely defines whatever the IPCC says as the "consensus", then not only does the "consensus" not agree with itself: it is galloping in the direction of the formerly-derided sceptics.

As to future world population, I did some research on this several years ago, because the UN was making alarmist noises and this alerted me to the likelihood that we were being fed political propaganda masquerading as science. I learned that the prime determinant of dP in any population is the general level of prosperity in that population. As prosperity increases, dP tends to zero. The prosperity factor is many times more potent as an influence on dP than even enforced, artificial contraception or child-killing. Since I expect world prosperity to increase in the coming century, I regard it as near-certain that dP will tend to zero in the next half-century. The reason for the plummet thereafter is the widespread availability and use of artificial methods of birth-control. The combined effects of rising general prosperity and the general availability of artificial birth-control on depressing indigenous population are already discernible in all those Western European populations not having to cope with mass immigration from poorer countries. In Russia, the indigenous population is falling so fast that Muslims will soon form more than half the population.

As to the "hockey-stick" problem, the NAS report does state very clearly that, though the conclusion of Mann et al. is "plausible", evidence going back more than 400 years before the present is increasingly unreliable, and that very few reliable conclusions can be drawn if one goes back more than 900 years. This illustrates one of the problems bedevilling the climate-change question: too much of the data and processes on the basis of which we are trying to draw conclusions are unreliable, incomplete or very poorly understood. This should not deter scientists from trying to make increasingly intelligent guesses: but anyone with diplomatic knowledge of the fast-emerging, fast-growing fast-polluters such as China, India, Indonesia and Brazil will tell you that the ruling regimes in these countries will not try to prevent their people from enjoying the fossil-fuelled economic growth we have already enjoyed unless and until the science is honest, the uncertainties are admitted and the case is strengthened by the accumulation of measurements and the improvement of analytical techniques in the coming years.

Finally, you are right to take me to task for using words such as "rubbish" and "useless". I apologize. That said, a validation skill not significantly different from zero indicates that no valid scientific conclusion may be drawn from the "hockey-stick" graph.

To: "Christopher Monckton"

Subject: Sea level rise, hi-res paleodata, etc.

Date: Wed, 27 Dec 2006 15:05:51 -0800 (PST)

Dear Dr. Monckton,

Thanks for copying me on your correspondence with Fred and prompting me to look again at IPCC sea level rise estimates for 2100. I agree you are comparing like-for-like. The 2001 report has an upper limit of 0.7 meters for the A1B scenario. If the 2007 report lowers this to 0.43 meters (or if the number gets raised again before the report is made final) it will certainly be appropriate to ask why. After reading Hansen's recent papers, I don't see how to justify such small upper limits.

It also seems obvious to me (and apparently to you but not to Fred) that the A2 scenario would entail more sea level rise than A1B. Regarding the relative likelihoods of scenarios, I don't agree with you that it's "almost certain" that world population will "plummet" in the second half of this century.

Regarding the issue of recent vs. earlier global warming, when I look at the totality of data compiled by North et al. this year for their NAS / NRC report (see attached graphic), it seems clear that most of the warming since about 1850 (or 1900) occurred in recent decades. Going farther back in time, the data are of course more uncertain and estimates vary, but it appears that the warming rate for the 20th century was unusually high compared with the past 2000 years. This conclusion follows whether or not one includes Mike Mann's data.

For the record, I must add that I do not share your characterization of Mann's work as "rubbish" or "useless." Nor do I see a situation of "flagrant dishonesty in which the UN and the scientific journals persist long after the falsity of their absurd and extreme claims has been properly demonstrated."

Sincerely,

Curt Covey

Christopher Monckton <monckton@mail.com> wrote:

Dear Fred, - Many thanks for sending me this exchange. Some comments:

Temperature: This question, like so many others to do with supposed "climate change", is bedevilled by the recency of reliable, instrument-based observations. Nevertheless, some conclusions can be attempted. The Dalton Minimum is generally considered to have come to an end in 1910. The five-year mean global land and sea surface air temperature anomaly for 1908-1912, calculated from NCDC annual figures, was -0.3579K. By 1940 there had been a rapid increase of 0.4700K to +1121K. By 2004 (again taking the five-year average, including

2006) there had been a further increase of +0.4413K to +0.5534. The mean annual increase in the 30 years 1010-1940 was thus 0.0157K more than two and a quarter times greater than the 0.0069K mean annual increase in the 64 years to 2004. Mean global temperature has hardly risen at all in the five years since the IPCC's last report. And the fact of the 20th-century temperature increase tells us nothing of the cause. It is interesting, for instance, that the polar icecaps on Mars are receding, inferentially in response to increased solar activity. At any rate, it is certain that anthropogenic planetary warming is not responsible. It is possible, therefore, that most of the warming both before and after 1940 was heliogenic.

Sea level: Your correspondent does not disagree with my statement that the IPCC has revised its upper-bound estimate of sea level rise to 17 inches (0.43m). He says, however, that this upper bound is based on the A1 scenario, by which world population will peak in mid-century at ~9bn and fall thereafter. So was the 2001 report's upper bound of 0.88m. I was correctly comparing like for like. The Sunday Telegraph, which reported these figures, has been told that the revisions arise from "better data" now available to the IPCC, supporting skeptics' conclusions that the IPCC's figures are little better than exaggerated guesses. Morner (2004) concludes firmly that there is little evidence for sea level rising any faster now than it has in geologically-recent times. Your correspondent says that the A2 scenario is "business-as-usual": in fact, it is an extreme scenario regarded by very nearly all serious demographers as absurdly unrealistic, in that it posits an increase in world population to 15bn by 2100, when it is now almost certain that rising prosperity and the consequent decrease in birth rates will cause population to peak somewhere between 9bn and 10bn in mid-century, and plummet thereafter.

Reliability of the IPCC's reports: I understand that the IPCC's 2007 draft does not contain an apology for the defective "hockey-stick" graph, which the US National Academy of Sciences has described as having "a validation skill not significantly different from zero". In plain English, this means the graph was rubbish. It is difficult to have confidence in a body which, after its principal conclusion is demonstrated in the peer-reviewed, scientific literature and in numerous independent reports as having been useless, fails to make the appropriate withdrawal and apology. Worse, the UN continues to use the defective graph. This failure of basic academic honesty on the IPCC's part was the main reason why I began my investigation of the supposed climate-change "consensus".

The supposed scientific "consensus": Your correspondent seems unaware of the letter written by 61 Canadian and other scientists in climate and related fields to the Canadian Prime Minister. At the end of the attached commentary on Al Gore's recent attempt to rebut my articles on climate change in the Sunday Telegraph, beneath the references, I have appended the full text of the letter and the names, qualifications and then-current affiliations of all 61 scientists. Al gore and others tend to lean rather more heavily than is wise upon a single, rather bad one-page essay in Science for their contention that there is a scientific consensus to the effect that most of the warming in the past half-century was anthropogenic. The essay was by Oreskes (2004), who said that she had analyzed 928 abstracts mentioning "climate change" published in peer-reviewed journals on the Thomson ISI database between 1993 and 2003, and that none of the 928 had expressed dissent from the "consensus". Dr. Benny Peiser of Liverpool John Moores University subsequently made a more careful enquiry. Science had been compelled to publish an erratum to the effect that the search term used by Oreskes had not been the neutral "climate change" - which returned some 12,000 articles, but the more loaded "global climate change", which returned 1,117 articles. Of these, Dr. Peiser found that only 1% had explicitly endorsed the "consensus" as defined by Oreskes"; that almost three times as many had explicitly expressed doubt or outright disagreement; and that less than one-third had expressed explicit or implicit agreement with the "consensus". He wrote a paper for Science pointing out these serious defects, which pointed to a conclusion diametrically opposite to that of Oreskes. Science at first asked him to shorten his paper, and then said that, because conclusions like his had been widely reported on the internet, his paper would not be published. As far as I can discover, Science has not published any corrigendum to this day, providing further confirmation of what I have long suspected: that the leading peer-reviewed journals, having unwisely taken strongly-political editorial positions on the question of climate change, are no longer objective.

The need for honest science: It was only after years of increasingly-public pressure that Nature was induced to oblige Mann et al., the authors of the useless "hockey-stick" graph that starred in the IPCC's 2001 report, to publish a mealy-mouthed, partial and unsatisfactory corrigendum. In such an environment of flagrant dishonesty in which the UN and the scientific journals persist long after the falsity of their absurd and extreme claims has been properly demonstrated, it is in my view unreasonable to expect China, India, Indonesia, Brazil and other fast-polluting countries to deny to themselves the fossil-fuelled economic growth which we in the West have been fortunate enough to enjoy. Until there is honest science, no one will believe either the UN or the journals to the extent of adopting the expensive and (on my calculations) probably futile remedial measures which they and their supporters so stridently advocate. - Christopher

From: "S. Fred Singer"

To: "Curt Covey"

Subject: Re: Belated response to "Say You're Sorry"

Date: Tue, 26 Dec 2006 08:37:25 -0500

At 07:15 PM 12/18/2006, Curt Covey wrote:

Received your 5 May 2006 e-mail via Andy Revkin last week. Regarding the Wall Street Journal and "other forums that substitute quips, showmanship, hyperbole, and conjecture for substantial discussion," the following recent quips from their Letters to the Editor may interest you:

Fred Singer's claim (13 December) that "more than 70% of the warming observed since the end of the Little Ice Age in 1850 occurred before 1940, and thus before much human-emitted CO₂." Fred has been saying this for a long time. I think it was true 20 years ago. Up-to-date records (e.g. this year's NAS report from North et al.) show that much more than half the warming since c.1850 has occurred after 1940.

Dear Curt, I am sure you are aware of the fact that such ratios depend entirely on the choice of time intervals. I don't want to quibble but surely the relevant fact is that most agree (incl IPCC -- but not Tom Wigley) that the pre-1940 warming was mostly due to natural causes.

Lord Monckton's claim (13 December) that "The U.N. [presumably IPCC] is about to cut its high-end estimate of sea-level rise in 2100 from three feet to just 17 inches." We are not supposed to discuss IPCC reports before they become final, but the last draft I saw does indeed project 17 inches (0.43 meters) of sea-level rise as the high-end climate model estimate from Emissions Scenario A1B. The scenario itself, however, is one in which (to quote IPCC) "global population peaks in mid-century and declines thereafter, and the rapid introduction of new and more efficient technologies" has atmospheric CO₂ leveling off by the end of the century. A business-as-usual scenario (like A2) would give much higher sea-level rise by 2100.

I don't think so. But you will have to read my forthcoming response to Rahmstorf (in ScienceExpress). Meanwhile, peruse the attached.

Senator Inhofe's comment today (18 December) that "60 scientists" together with "Claude Allegre, a leading French scientist who is a member of both the U.S. and French National Academies of Sciences" have concluded that agreements like Kyoto are "unnecessary" because "the cause of global warming is 'unknown.'" Presumably true, but so what? Allegre is an award-winning geochemist; the other 60 scientists are unidentified. There are tens of thousands of members of the American Geophysical Union alone (many of whom are petroleum geologists). I'm sure you can find a few hundred to support any claim you want to make about global warming.

I am one of the 60 -- and I am sure you know most of the other 59.

Date: Mon, 19 Feb 2007 11:10:02 -0500

Hi, Phil,

I thought you might enjoy the forwarded picture and related commentary below.

I read some of the USHCN/GISS/CRU brouhaha on web site you sent us. It is both interesting and sad. It reminds me of a talk that Fred Singer gave in which he impugned the climate record by saying he didn't know how different parts were put together. During the question part, Bob Livzey said, if you don't know how it is done you should read the papers that describe it in detail. So many of the comments on that web page could be completely addressed by pointing people to different papers. Ah well, you can lead a horse to water but you can't make it think.

Warm regards,
Tom

Subject: Re: Copy-edited Ch. 3 files
Date: Wed, 21 Feb 2007 08:18:03 -0700
Cc: Phil Jones <p.jones@uea.ac.uk>, Martin Manning <mmanning@al.noaa.gov>, Susan Solomon <ssolomon@al.noaa.gov>

Hi all
I have ftp'd the updated cleaned up files from chapter 3 back onto your ftp site. The notes accompanying these are attached and are unchanged from yesterday. There are two references that may not be quite final. These are from Global and Planetary Change and we have doi's for them as they are published online, but no page numbers as they do not seem to have appeared yet in print. By the way, there was one notable error in the copy editing which was confusion over significance and confidence levels. I removed all the references to confidence levels when it was about significance (of trends etc). I suspect this could affect other chapters though, so you may want to check that carefully. The main concerns we have are with the figures, please see the comments on the figure files and the brief comments in the attached. If you would like me to make any of these changes (Kristen) or assemble the panels, please let me know.

Regards

Kevin

Phil Jones wrote:

Melinda et al,

I'm happy with the chapter once all the mods - mainly to the figures - are undertaken. I won't get a chance this weekend, nor the next two days as I'm away. I might have some more time next week, but I too have spent about 6 hours on Sunday and another 2-3 hours on Monday. So Kevin can send back the accepted/tracked version of the chapter, the captions and Appendix 3.B.

On the figures, will we get a chance to see the Chapter mocked-up with figures in their final positions and sizes - as we would do with journal papers? There are a number, which we'd like to check to make sure the colours are OK.

I think by the way that you have caught all the spellings correctly. I noted 'fall' changing to 'autumn' and the doubling up of letters in words like 'modelling'. I hear also from Keith Briffa that Ch 6 now spells the word palaeoclimatic, although we normally drop the extra 'a' even in English journals.

Cheers

Phil

At 23:14 20/02/2007, Kevin Trenberth wrote:

Melinda

Thanks

Phil and I have made a preliminary pass through the material. As Kristen is now considering the figures, I have attached a preliminary list of the problems. This also includes some material for you: acronyms. More detail is given on the full figure file. We have left USA as is in the main text, but I note that the Appendix B was not copy edited and we have left "United States" there. We have accepted most other changes even though I would not do them this way! We can send the material back now but I will

wait for a last check by Phil. (I spent over 12 hours on this over the weekend).

Kevin

Melinda Marquis wrote:

Hi, Kevin,

Thank you for reviewing your copy-edited chapter files -- thoroughly and promptly. I'll try to answer each of your questions.

About the convention for referring to the United States: As this document is published under the auspices of the United Nations, we are required to use official country names; the United States of America is to be abbreviated as "USA" for such publications.

Regarding the lower case "antarctica": We have capitalized "Arctic" and "Antarctic" when they are nouns, and have used lower case "arctic" and "antarctic" when they are adjectives. We used the AMS Word List

(http://www.ametsoc.org/PUBS/Authorsguide/pdf_vs/authguide.pdf) to supplement our style guide. The AMS list cites "arctic flow" (adj.) and "Arctic Circle" (noun). We thought it appropriate to treat "antarctic" analogously to "arctic" (the adjectival form).

About suggested revisions that seem pedantic: If you feel that inserting "the period" before things like 1961 to 1990 would decrease clarity or change the meaning from what is intended, then you may of course reject such changes.

Thank you for your careful review. Kristen will be replying to you about the figures.

Please let us know if you have further concerns. We want everything to be correct.

Cheers,

Melinda

Kevin Trenberth wrote:

Melinda

There appear to be changes that I do not agree with. For instance, everywhere we had "United States" it has been changed to USA. That is not the practice in AMS or AGU journals. I have also found several instances of Antarctic changed to lower case which is surely not right!!!! Some changes are very pedantic: inserting "the period" before things like 1961 to 1990.

Kevin

Melinda Marquis wrote:

Dear CLAs,

Thank you very much for your invaluable assistance during the recent SPM plenary meeting. As you will realise there are a few remaining steps that need to be completed before final completion of the WG1-AR4 but these should now be straightforward. This is to ask for your help in the next of these steps which is to check the copy-edited version of your chapter.

A professional copy-editor has reviewed all chapters of the AR4 and made some revisions. In most cases, her suggestions implement our style guide (see attached) for consistency in punctuation, spelling, grammar and language style across all chapters, points at which acronyms are spelled out, etc, etc. In a few cases, she has suggested revised wording for the sake of clarity, improved grammar or such. All these changes that might have some effect on the meaning of a sentence are shown in track-changes mode.

We would be grateful if you would now go through these edited chapter files and either accept, reject, or modify the copy-editor's tracked revisions and return "cleaned up" files to the TSU. During this step you should also:

- * make any remaining necessary and minor corrections to text or tables;
- * ensure that any corrections or updates provided to the TSU since the distribution of the final draft in October 2006, have been included;
- * update references that have been published recently by inserting volume and page numbers, etc;
- * add any adjustments to your chapter that arose from the SPM approval process in Paris.

Please return a checked file to us with all tracked changes removed.

Please also remember to check your figures and figure captions carefully including the axis labels, units used, etc. Annotated text should already have been edited to follow the styles used in the text where appropriate. In some cases we will be doing further improvements to the text fonts used in figures but this is your last chance to ensure that the wording is correct in all places. If you wish to make any small revisions to figures, please contact Kristen Averyt ([2]averyt@ucar.edu) as soon as possible.

Please remember that no substantive changes, or new references, can be made to your chapter at this stage.

The time line for delivering the camera-ready copy to the publisher is quite tight. We ask that you please return your final text and figures files to the TSU by Friday, March 9.

You may access your chapter files at the following ftp site.

server: [3]ftp.joss.ucar.edu

account: wgl_gnrl

password: EQ0KW0WG (Please note that these are zeros - not letters.)

directory: pub/AR4_CopyEditFinal/ChXX

The file names currently contain "_TSU." We ask that you change these characters to "_CLA" in the files you return to us. Finally please notify us at

[4]ipcc-wgl@al.noaa.gov when you have uploaded the checked files.

Best regards,

Melinda Marquis

Here is the old version for you to compare with... the only noticeable difference is for the URALS/YAMAL region, which previously had a higher peak near 1000 AD. Although that was quite a big change, once you average it with the other two series, the overall mean series shows very little difference.

Cheers

Tim

<x-flowed>

now for the Figures (this file is crashing my Word software systematically!)

Figure 6.3

OK with suggestion

Someone has to check the many comments on Figure 6.7 and 6.15 (Fortunat?)

Figure 6.9 : I cannot generate S and N latitudes, can someone of you edit the figure to generate positive latitudes?

Same for Figure Box 6.1, Figure 1 : they suggest to label the RH vertical axes but they have the same unit as the LH vertical axis. How should I proceed?

For Figure Box 6.3, 1 : should Olga reprocess it? (they ask for a change in caption)

FAQ should refer to Figure 1, Faq 6.1

APPENDIX

The definition of O-isotopes is partly false.

The isotopic composition of ice depends on temperature not because the fractionation coefficients depend on temperature but due to the progressive distillation of water masses en route for the poles. Even if fractionation coefficients were to be independent of temperature would one see a temperature / isotopic composition relationship.

All the best,

Valérie.

Dear all,

Below are my comments addressing issues to Section 6.4 and associated figures. It would be good if Fortunat can also check especially Box 6.2, 6.4 intro, 6.4.1.1, and 6.4.1.5 written by Dominique and Fortunat.

Bette

Figures:

- * Figure 6.3, Valerie has checked comments.
- * Figure 6.4 and 6.7, Fortunat(?) should check the figures, legends, and comments.
- * Figure 6.5, line 8: generally feedbacks in glacial-interglacial ...
line 19: Simon Laplace Climate System Model (IPSL-CM) ...
line 21: ECBilt-CLIO is not an acronym as far as I can tell.
- * Figure 6.6, line 5: minimum ice thickness and extent ...
line 6: Delete "at approximately 130 to 125 ka".
line 9: ... and the ECHAM4 HOPE-G (ECHO-G) model ...
- * Figure 6.8, Dick should check that the legend is revised correctly and that color code in this figure is consistent with text.

Text 6.4:

- * Page 6-11, line 9: corresponding to other orbital periods ...
- * Page 6-11, line 13: adopt Valerie's wording of last sentence.
- * Page 6-11, line 37: the SOD has ~180 ppm and ~265 ppm. Is the change to < intentional in response to a review comment?
- * Page 6-11, line 38: adopt Valerie's wording of sentence.
- * Page 6-11, line 49: OK to delete redundant sentence.
- * Box 6.1: See Valerie comments.
- * Box 6.2: Changes look OK. Fortunat should check.
- * Page 6-15, lines 49-50: ... to the very different conditions at the LGM.
- * Page 6-16, line 2: PMIP-2 simulations ...
- * Page 6-16, line 31: Change does not make sense. The PMIP2 models do not simulate changes of greenhouse gases or ice sheets. These are prescribed. This sentence could be revised to read: The PMIP-2 AOGCM simulations using glacial-interglacial ...
- * Page 6-17, line 23: I am fine with Last Interglacial. Peck may also want to comment. The SPM uses the last interglacial period.
- * Page 6-17, line 41: ... warming over Eurasia and in the Baffin Island/northern Greenland region ... I am OK with taking out "with sea ice retreat" at the end of the sentence if that is awkward.
- * Page 6-17, line 43: Kaspar and Cubasch, 2006.
- * Page 6-18, line 1: Models and data now show ...
- * Page 6-18, line 6: adopt Valerie's wording of sentence.
- * Page 6-18, line 38: D-O is one of the abbreviations in the literature so I am fine with this change. Need to be consistent and change Page 6-19, line 49 to D-O.
- * Page 6-18, line 43: adopt Valerie's wording of sentence.
- * Page 6-21, line 12: Dick can advise if ICE-4G, ICE-5G, and VM2 are acronyms.
- * Page 6-21, line 20: Dick should be consulted to make sure sentence

meaning is OK with changes.

* Page 6-21, line 43: Dick can advise if J stands for Joseph.

* Page 6-21, line 51: Dick should be consulted on color code in Figure 6.8 and consistency with text.

* Page 6-22, line 2: Replace "longer" with "older". Valerie please comment if this is a more correct wording. Note that neither Landais et al., 2003 or Suwa et al., 2006 are currently in the reference list. Eystein/Peck, please advise if it is possible to add new references. Valerie, could we use Landais et al, 2006, which is already in the reference list, here?

* Page 6-22, line 10: OK to spell out GIS

* Page 6-22, line 11: the growth ...

* Page 6-22, line 16: Peck, can you comment "if sea level rise during the LIG" is an OK edit.

* Page 6-22, lines 25-29: Possible combination of last two sentences. Peck, please check that this conveys your original meaning: Overpeck et al. (2006) argued ... significant retreat of the Greenland Ice Sheet (and perhaps also parts of the Antarctic Ice Sheet) can be expected to occur under this future condition (see also Scherer et al. ...).

References:

Kaspar and Cubasch: published in 2006. editor order should be Sirocko, Claussen, Litt, and Sanchez-Goni. I couldn't find the location or page numbers for this publication.

NRC: OK

Otto-Bliesner: reversal of a and b OK

Peltier and Fairbanks, 2006: 25(23-24), 3322-3337.

Sarnthein: reversal of a and b OK

Taylor: OK

FAQ 6.1 and 6.2 need to be revised to refer to the correct sections of Chapter 6. Most of the references are incorrect and look to be based on an old outline of the chapter.

Appendix:

Need consistency with changes in chapter: Palaeocene, palaeosols(?)

Dear Hugues,

I agree and what Damien said echoes what Keith is concerned about. We need to expand the timescale of Millennium AND focus much more on sensitivity and predictability.

best wishes

Eystein

Den 7. mar. 2007 kl. 11.22 skrev Hugues Goosse:

Hi Eystein,

Thanks a lot for the information. I agree with you that it is very important that the topic "Earth system dynamics: Palaeoenvironmental analysis" includes explicitly our area of interest. By the way, I have briefly discussed with Damien Cardinal after the meeting yesterday. He told me that the EU has already funded recently a very big project over the last Millennium, so they will be reluctant to make a new call covering this subject but we can certainly sell our science in something more general like 'natural variability and climate predictability'.

All the best

Hugues

Le 15:00 06/03/2007, vous avez écrit:

Hi Keith and Hugues,

Here are two documents re. our discussion of FP7 topics.

As you will see the plan is to have the following topic out in 2008 or later: Â·

Earth system dynamics: Palaeoenvironmental analysis

I think it will be important that the topic really comes in 2008 and that it includes the terms natural variability and climate predictability when it is described in the call. If possible our national program committee members should be contacted to propose this. As far as I know there will be a meeting later this spring to discuss the next calls.

Cheers

Eystein

From: Eystein Jansen <eystein.jansen@geo.uib.no>
To: Richard Somerville <rsomerville@ucsd.edu>
Subject: Re: [Wg1-ar4-clas] Responding to an attack on IPCC and ourselves
Date: Thu, 8 Mar 2007 08:16:33 +0100
Cc: wg1-ar4-clas@joss.ucar.edu

Hi,

just a quick reply. I am in on this, and will respond to a draft letter, in the hope that you will make the first, Richard? I agree that it can be short. It is strange to see this, knowing that the delegations I spoke to in/after Paris clearly said that the CLAs got it their way, and that I believe this is the strong common perception we also had as CLAs about the outcome.

Best wishes,

Eystein

Den 8. mar. 2007 kl. 03.11 skrev Richard Somerville:

Dear Fellow CLAs,

The British magazine **New Scientist** is apparently about to publish several items critical of the IPCC AR4 WGI SPM and the process by which it was written. There is an editorial, a column by Pearce, and a longer piece by Wasdell which is on the internet and referenced by Pearce.

I think that this attack on us deserves a response from the CLAs. Our competence and integrity has been called into question. Susan Solomon is mentioned by name in unflattering terms. We ought not to get caught up in responding in detail to the many scientific errors in the Wasdell piece, in my opinion, but I would like to see us refute the main allegations against us and against the IPCC.

We need to make the case that this is shoddy and prejudiced journalism. Wasdell is not a climate scientist, was not involved in writing AR4, was not in Paris, and is grossly ignorant of both the science and the IPCC process. His account of what went on is factually incorrect in many important respects.

New Scientist inexplicably violates basic journalistic standards by publicizing and editorially agreeing with a vicious attack by an uncredentialed source without checking facts or hearing from the people attacked. The editorial and Pearce column, which I regard as packed with distortions and innuendo and error, are pasted below, and the Wasdell piece

is attached.

My suggestion is that a strongly worded letter to New Scientist, signed by as many CLAs as possible, would be an appropriate response. I think we ought to say that the science was absolutely not compromised or watered down by the review process or by political pressure of any kind or by the Paris plenary. I think it would be a mistake to attempt a detailed point-by-point discussion, which would provoke further criticism; that process would never converge.

Please send us all your opinions and suggestions for what we should do, using the email list [1]wg1-ar4-clas@joss.ucar.edu

I am traveling and checking email occasionally, so if enough of us agree that we should respond, I hope one or more of you (not me) will volunteer to coordinate the effort and submit the result to New Scientist.

Best regards to all,

Richard

--

Here's the editorial that will appear in New Scientist on March 10.

Editorial: Carbon omissions

IT IS a case of the dog that didn't bark. The dog in this instance was the Intergovernmental Panel on Climate Change.

For several years, climate scientists have grown increasingly anxious about "positive feedbacks" that could accelerate climate change, such as methane bubbling up as permafrost melts. That concern found focus at an international conference organised by the British government two years ago, and many people expected it to emerge strongly in the latest IPCC report, whose summary for policy-makers was published in Paris last

month.

It didn't happen. The IPCC summary was notably guarded. We put that down to scientific caution and the desire to convey as much certainty as possible (New Scientist, 9 February, p 3), but this week we hear that an earlier version of the summary contained a number of explicit references to positive feedbacks and the dangers of accelerating climate change. A critique of the report now argues that the references were removed in a systematic fashion (see "Climate report 'was watered down'").

This is worrying. The version containing the warnings was the last for which scientists alone were responsible. After that it went out to review by governments. The IPCC is a governmental body as well as a scientific one. Both sides have to sign off on the report.

The scientists involved adamantly deny that there was undue pressure, or that the scientific integrity of their report was compromised. We do know there were political agendas, and that the scientists had to fight them. As one of the report's 33 authors put it: "A lot of us devoted a lot of time to ensuring that the changes requested by national delegates did not affect the scientific content." Yet small changes in language which individually may not amount to much can, cumulatively, change the tone and message of a report. Deliberately or not, this is what seems to have happened.

Senior IPCC scientists are not willing to discuss the changes, beyond denying that there was political interference. They regard the drafting process as private. This is an understandable reservation, but the case raises serious doubts about the IPCC process. A little more transparency would go a long way to removing those qualms.

--

Here's the Pearce column:

Climate report 'was watered down'

* 10 March 2007

* From New Scientist Print Edition. [2]Subscribe and get 4 free issues.

* Fred Pearce

BRITISH researchers who have seen drafts of last month's report by the Intergovernmental Panel on Climate Change claim it was significantly watered down when governments became involved in writing it.

David Wasdell, an independent analyst of climate change who acted as an accredited reviewer of the report, says the preliminary version produced by scientists in April

2006 contained many references to the potential for climate to change faster than expected because of "positive feedbacks" in the climate system. Most of these references were absent from the final version.

His assertion is based on a line-by-line analysis of the scientists' report and the final version, which was agreed last month at a week-long meeting of representatives of more than 100 governments. Wasdell told New Scientist: "I was astounded at the alterations that were imposed by government agents during the final stage of review. The evidence of collusional suppression of well-established and world-leading scientific material is overwhelming."

He has prepared a critique, "Political Corruption of the IPCC Report?", which claims: "Political and economic interests have influenced the presented scientific material." He plans to publish the document online this week at [3]www.meridian.org.uk/whats.htm.

Wasdell is not a climatologist, but his analysis was supported this week by two leading UK climate scientists and policy analysts. Ocean physicist Peter Wadhams of the University of Cambridge, who made the discovery that Arctic ice has thinned by 40 per cent over the past 25 years and also acted as a referee on the IPCC report, told New Scientist: "The public needs to know that the policy-makers' summary, presented as the united words of the IPCC, has actually been watered down in subtle but vital ways by governmental agents before the public was allowed to see it."

"The public needs to know that the summary has been watered down in subtle but vital ways by governmental agents"

Crispin Tickell, a long-standing UK government adviser on climate and a former ambassador to the UN, says: "I think David Wasdell's analysis is very useful, and unique of its kind. Others have made comparable points but not in such analytic detail."

Wasdell's central charge is that "reference to possible acceleration of climate change [was] consistently removed" from the final report. This happened both in its treatment of potential positive feedbacks from global warming in the future and in its discussion of recent observations of collapsing ice sheets and an accelerating rise in sea levels.

For instance, the scientists' draft report warned that natural systems such as rainforests, soils and the oceans would in future be less able to absorb greenhouse gas emissions. It said: "This positive feedback could lead to as much as 1.2 °C of added warming by 2100." The final version does not include this figure. It acknowledges that the feedback could exist but says: "The magnitude of this feedback is uncertain."

Similarly, the draft warned that warming will increase atmospheric levels of water vapour, which acts as a greenhouse gas. "Water vapour increases lead to a strong

positive feedback," it said. "New evidence estimates a 40 to 50 per cent amplification of global mean warming." This was absent from the published version, replaced elsewhere with the much milder observation "Water vapour changes represent the largest feedback."

The final edit also removed references to growing fears that global warming is accelerating the discharge of ice from major ice sheets such as the Greenland sheet. This would dramatically speed up rises in sea levels and may already be doing so. The 2006 draft said: "Recent observations show rapid changes in ice sheet flows," and referred to an "accelerating trend" in sea-level rise. Neither detail made the final version, which observed that "ice flow from Greenland and Antarctica... could increase or decrease in future". Wasdell points out recent findings which show that the rate of loss from ice sheets is doubling every six years, making the suggestion of a future decrease "highly unlikely".

Some of the changes were made at the meeting of government invigilators that finalised the report last month in Paris. But others were made earlier, after the draft report was first distributed to governments in mid-2006.

Senior IPCC scientists contacted by New Scientist have not been willing to discuss how any changes took place but they deny any political interference. However, "if it is true, it's disappointing", says Mike Mann, director of the Earth System Science Center at Pennsylvania State University in University Park and a past lead author for the IPCC. "Allowing governmental delegations to ride into town at the last minute and water down conclusions after they were painstakingly arrived at in an objective scientific assessment does not serve society well."

Hi Stefan - Valerie was the lead on the Holocene section, so I'll cc her. I agree that your approach is the smart one - it's easy to show proxy records (e.g., speleothems) from a few sites that suggest greater warmth than present at times in the past, but our assessment was that there wasn't a period of GLOBAL warmth comparable to present. We used the term likely, however, since there still is a good deal of work to do on this topic - we need a better global network of sites.

Keith can comment on the last 1300 years, but again, I think there is no published evidence to refute what we assessed in the chapter. Again, one or two records does not hemispheric or global make.

I think Keith or Valerie could comment further if they're not Eastering. Eystein, likewise might have something, but I think it is his national responsibility to hit the glaciers over Easter.

Phil

Thanks for your reply. I have removed the 'since 1950' from the TS. That was taken from your ES but in view of this discussion I think the reader needs to go to the chapter.

Please note that 'Since 1950' is not (and never was) in the SPM, so there is no interplay at all between the issues being discussed in this series of emails and anything that occurred in Paris or prior to Paris.

It was, of course, for you to decide what you wanted in your ES and how to mesh that with the main text of your chapter. It is entirely a 'within chapter' issue.

best regards,
Susan

Chris et al,

I'll sedn some more thoughts on Thursday when back from the EGU. It is too hot in Vienna to sit through too many talks !

I suspect we need a subset of indices. The program will calculate all those recommended in various programs. One possibility is to keep them all and let users decide. We do need to make a series of checks though at some stage to make sure they are OK.

I think you'll have some fruitful discussions on some of these on April 24. I hope you can come to closure on a few things.

Cheers

Phil

Hi Phil

I am sure you know that this is not about the science. It is an attack to undermine the science in some way. In that regard I don't think you can ignore it all, as Mike suggests as one option, but the response should try to somehow label these guys and lazy and incompetent and unable to do the huge amount of work it takes to construct such a database. Indeed technology and data handling capabilities have evolved and not everything was saved. So my feeble suggestion is to indeed cast aspersions on their motives and throw in some counter rhetoric. Labeling them as lazy with nothing better to do seems like a good thing to do.

How about "I tried to get some data from McIntyre from his 1990 paper, but I was unable because he doesn't have such a paper because he has not done any constructive work!"

There is no basis for retracting a paper given in Keenan's message. One may have to offer a correction that a particular sentence was not correct if it claimed something that indeed was not so. But some old instrumental data are like paleo data, and can only be used with caution as the metadata do not exist. It doesn't mean they are worthless and can not be used. Offering to make a correction to a few words in a paper in a trivial manner will undermine his case.

Kevin

Hi Phil,

This is all too predictable. This crowd of charlatans is always looking for one thing they can harp on, where people w/ little knowledge of the facts might be able to be convinced that there is a controversy. They can't take on the whole of the science, so they look for one little thing they can say is wrong, and thus generalize that the science is entirely compromised. Of course, as nicely shown in the SPM, every landmass is independently warming, and much as the models predict. So they can harp all they want on one Chinese data set, it couldn't possibly change the big picture (let alone even the trends for China). The

So they are simply hoping to blow this up to something that looks like a legitimate controversy. The last thing you want to do is help them by feeding the fire. Best thing is to ignore them completely. They no longer have their friends in power here in the U.S., and the media has become entirely unsympathetic to the rants of the contrarians at least in the U.S.--the Wall Street Journal editorial page are about the only place they can broadcast their disinformation. So in other words, for contrarians the environment appears to have become very unfavorable for development. I would advise Wang the same way. Keenan may or may not be bluffing, but if he tries this I believe that British law would make it easy for Wang to win a defamation suit against him (the burden is much tougher in the states),

mike

Dear Phil,

Sorry about the delay in replying to your email - I've been out of my office for a few days.

This is really nasty stuff, and I'm sorry that it's happened to you. The irony in this is that you are one of the most careful and thorough scientists I know.

Keenan's allegations of research misconduct, although malicious and completely unfounded, clearly require some response. The bottom line is that there are uncertainties inherent in measuring ANY properties of the real-world climate system. You've probably delved deeper than anyone else on the planet into uncertainties in observed surface temperature records. This would be well worth pointing out to Mr. Keenan. The whole tenor of the web-site stuff and Keenan's garbage is that these folks are scrupulously careful data analysts, and you are not. They conveniently ignore all the pioneering work that you've done on identification of inhomogeneities in surface temperature records. The response should mention that you've spent much of your scientific career trying to quantify the effects of such inhomogeneities, changing spatial coverage, etc. on observed estimates of global-scale surface temperature change.

The bottom line here is that observational data are frequently "messy". They are not the neat, tidy beasts Mr. Keenan would like them to be. This holds not only for surface temperature measurements. It also holds - in spades - for measurements of tropospheric temperature from MSU and radiosondes, and for measurements of ocean temperatures from XBTs, profiling floats, etc. We would like observing systems to be more accurate, more stable, and better-suited for monitoring decadal-scale changes in climate. You and Kevin and many other are actively working towards that goal. The key message here is that, despite uncertainties in the surface temperature record - uncertainties which you and others in the field are well aware of, and have worked hard to quantify - it is

now unequivocal that surface temperatures have warmed markedly over the past 100 years. Uncertainties in the station histories do not negate this basic message.

Hope some of these random musings might be useful, Phil. Let me know if there's anything else I can do to help. Will you be at the Hadley Centre Science Review Group meeting in May?

With best regards,

Ben

Dear Phil,

I looked at some of the stuff on the Climate Audit web site. I'd really like to talk to a few of these "Auditors" in a dark alley. They seem to have no understanding of how science is actually done - no appreciation of the fact that uncertainty is an integral part of what we do. Once again, just let me know how I can help....

It will be good to see you in Exeter. I'm looking forward to that. I'll have two nights in London after the meeting, and am hoping to spend some time wandering around the British Museum.

I met a very nice lady (Stephanie) while I was giving a series of climate change lectures in Puerto Rico back in January. She's a Professor at the University of San Francisco, and (fortuitously), specializes in the policy implications of climate change, risk assessment, etc. She also likes hiking and climbing. It's fun to "have a life" again (as they say over here).

Best wishes to you and Ruth,

Ben

Subject: Re: quick note on TAR

Date: Sun Apr 29 19:53:16 2007

Mike

your words are a real boost to me at the moment. I found myself questioning the whole process and being often frustrated at the formulaic way things had to be done - often wasting time and going down dead ends. I really thank you for taking the time to say these kind words . I tried hard to balance the needs of the science and the IPCC , which were not always the same. I worried that you might think I gave the impression of not supporting you well enough while trying to report on the issues and uncertainties . Much had to be removed and I was particularly unhappy that I could not get the statement into the SPM regarding the AR4 reinforcement of the results and conclusions of the TAR. I tried my best but we were basically railroaded by Susan. I am happy to pass the mantle on to someone else next time. I feel I have basically produced nothing original or substantive of my own since this whole process started. I am at this moment , having to work on the ENV submission to the forthcoming UK Research Assessment exercise , again instead of actually doing some useful research ! Anyway thanks again Mike.... really appreciated when it comes from you
very best wishes

Keith

Keith

At 18:14 29/04/2007, you wrote:

Keith, just a quick note to let you know I've had a chance to read over the key bits on last millennium in the final version of the chapter, and I think you did a great job. obviously, this was one of the most (if not the most) contentious areas in the entire report, and you found a way to (in my view) convey the the science accurately, but in a way that I believe will be immune to criticisms of bias or neglect--you dealt w/ all of the controversies, but in a very even-handed and fair way. bravo!
I hope you have an opportunity to relax a bit now. looking forward to buying you a beer next time we have an opportunity :)

mike

<x-flowed>

Dear Phil,

Thanks very much for the quick reply. It would be nice to get hold of CRU TS 3.0, even at the 0.5 x 0.5 degree resolution.

For the SST detection and attribution analysis that I described yesterday, I reduced the spatial dimensionality (to get better estimates of covariance matrices, EOFs, etc.) by regridding all model and observational SST data to a common 10 x 10 lat/long grid. I think it would make sense to do the detection and attribution analysis involving the land 2m temperature changes at the same 10 x 10 resolution. So it isn't essential for me to get the CRU TS 3.0 data at 5 x 5 resolution - we might as well have just one regridding step (from 0.5 x 0.5 to 10 x 10) rather than two. As in the SST case, the primary focus would be on land 2m temperature changes over 1950 to 2006. I'm hopeful that the changing coverage/variance issues won't be that severe over this period.

Let me back up a little and outline why I want to look at CRU TS 3.0.

I've always thought that it would be fun to contrast the S/N behavior of SST and land 2m temperature. Based purely on the amplitude of unforced variability, one might expect S/N ratios to be more more favorable for SST changes than for land 2m temperature changes. But it's not that simple! Due to land/ocean differences in specific and total heat capacity, we expect the GHG-induced surface temperature signal to be larger over land than over oceans. And then there's the issue of the spatial heterogeneity of the forcings. Arguably, anthropogenic forcings over land are more spatially heterogeneous than over oceans (e.g., no changes in land surface properties over oceans!). Such land/ocean forcing differences must also influence the S/N behavior of temperature changes over land and oceans.

So I suspect, based on S/N arguments, that it's better to search for an anthropogenic surface temperature signal over the oceans rather than the

land. Actually showing this might be useful.

Cheers,

Ben

yep, I'm watching the changing of the guard live on TV here!

New Scientist was good. Gavin and I both had some input into that. They are nicely dismissive of the contrarians on just about every point, including the HS!

Heard anything back from IUGG yet? I thought Mike's email was helpful, if that doesn't do the trick I don't know what will,

mike

Subject: RE: Invitation to review IPCC Technical Paper on Climate Change and Water

Date: Mon, 21 May 2007 12:45:15 +0100

Dear colleague,

Please find attached the spreadsheet needed for submitting your review comments on the IPCC

Technical Paper on Climate Change and Water. This was accidentally omitted from the email

below.

The Technical Paper and supporting review documents are also available online at:

[1]www.ipcc-wg2.org/review/index.html

username: GEreview

password: water08

Regards,

Paul

Paul van der Linden, Deputy Head (IT)
IPCC WGII TSU, Met Office, Fitzroy Road
Exeter EX1 3PB, United Kingdom

At 12:00 2007.05.21, you wrote:

Dear colleague,
The First-Order Draft of the IPCC Technical Paper on Water
The IPCC requested the preparation of a Technical Paper on Water, to be based primarily on the results of the Fourth Assessment (AR4), and to involve all three Working Groups.
Organization of the process is in the charge of Working Group II.
The Expert Review for the First-Order Draft of the Technical Paper on Water will begin on May 21st, and will run for four weeks until June 17th. It is essential for the success of the process that we involve the widest community of internationally-recognized researchers in the review. We have identified you as someone whose reputation and contribution to the science is such that your participation is important. Therefore, we are sending you a First-Order Draft, with a request to review the Technical Paper. We would be most grateful if you can find time from your busy

schedule to review the Technical Paper. If you can only find time to review those

sections that are most close to your professional interests, we would still be pleased

to receive your comments, although of course we also need reviews which take a broader view of the coherence and completeness of the document as a whole.

We attach the following:

1. The draft Technical Paper on Water. This is in PDF format, because it is important to preserve the page and line numbers.

2. Background information on the Technical Paper, in the form of a Scoping Note.

3. A spreadsheet for you to use to make your comments. Instructions on how to use this spreadsheet are provided at the beginning.

The deadline for the submission of review comments is June 17th. Comments should be

submitted, using the spreadsheet, to [2]ipcc-wg2@metoffice.gov.uk .

Please note that, if you have been nominated by your government for any role in the

Fourth Assessment other than Review Editor, you may receive a separate invitation from

us inviting you to be an Expert Reviewer in that capacity.

We do hope that you will be able to find time to comment on this draft. In advance, we

would like to express our deep gratitude for any contribution you can make. In

recognition of the importance of the reviewing process, reviewers' names will be listed

in the final published Technical Paper.

Yours sincerely,

Oswaldo Canziani

Co-Chair, Working Group II

Martin Parry

Co-Chair, Working Group II

Jean Palutikof

Head, WGII TSU

Hi Phil, sorry for the long delay. But here is a first draft of the forcings and models section I was supposed to take the lead on. Hopefully, we can merge that with whatever Caspar has.

Thanks

Gavin

=====

4 Forcing (GS/CA/EZ) 4-5pp

Histories (CA)

How models see the forcings, especially wrt aerosols/ozone and increasing model complexities (GS)

An important reason for improving climate reconstructions of the past few millenia is that these reconstructions can help us both evaluate climate model responses and sharpen our understanding of important mechanisms and feedbacks. Therefore, a parallel task to improving climate reconstructions is to assess and independently constrain forcings on the climate system over that period.

Forcings can generically be described as external effects on a specific system. Responses within that system that also themselves have an impact on its internal state are described as feebacks. For the atmosphere, sea surface temperature changes could therefore be considered a forcing, but in a coupled ocean-atmosphere model they could be a feedback to another external factor or be intrinsic to the coupled system. Thus the distinction between forcings and feedbacks is not defined a priori, but is a function of the scope of the modelled system. This becomes especially important when dealing with the bio-geo-chemical processes in climate that effect the

trace gas concentrations (CO₂ and CH₄) or aerosols. For example, if a model

contains a carbon cycle, then the CO₂ variations as a function of climate will be a feedback, but for a simpler physical model, CO₂ is often imposed directly as a forcing from observations, regardless of whether in the real world it was a feedback to another change, or a result of human industrial activity.

It is useful to consider the pre-industrial period (pre-1850 or so) separately from the more recent past, since the human influence on many aspects of atmospheric composition has increased dramatically in the 20th Century. In particular, aerosol and land use changes are poorly constrained prior to the late 20th Century and have large uncertainties. Note however, there may conceivably be a role for human activities even prior to the 19th Century due to early agricultural activity (Ruddiman, 2003; Goosse et al, 2005).

In pre-industrial periods, forcings can be usefully separated into purely external changes (variations of solar activity, volcanic eruptions, orbital variation), and those which are intrinsic to the Earth system (greenhouse gases, aerosols, vegetation etc.). Those changes in Earth system elements will occur predominantly as feedbacks to other changes (whether externally forced or simply as a function of internal climate 'noise'). In the more recent past, the human role in affecting atmospheric composition (trace gases and aerosols) and land use have dominated over natural processes and so these changes can, to large extent, be considered external forcings as well.

Traditionally, the 'system' that is most usually implied when talking about forcings and feedbacks are the 'fast' components atmosphere-land surface-upper ocean system that, not coincidentally, corresponds to the physics contained within atmospheric general circulation models (AGCMs) coupled to a slab ocean. What is not included (and therefore considered as a forcing according to our previous definition) are 'slow' changes in vegetation, ice sheets or the carbon cycle. In the real world these features will change as a function of other climate changes, and in fact may do so on relatively 'fast' (i.e multi-decadal) timescales. Our choice then of the appropriate 'climate system' is thus slightly arbitrary and does not give a complete picture of the long term sensitivity of the real climate.

These distinctions become important because the records available for atmospheric composition do not record the distinction between feedback or forcing, they simply give, for instance, the history of CO₂ and CH₄. Depending on the modelled system, those records will either be a modelling input, or a modelling target.

While there are good records for some factors (particularly the well mixed greenhouse gases such as CO₂ and CH₄), records for others are either hopelessly incomplete (dust, vegetation) due to poor spatial or temporal resolution or non-existent (e.g. ozone). Thus estimates of the magnitude of these forcings can only be made using a model-based approach. This can be done using GCMs that include more Earth system components (interactive aerosols, chemistry, dynamic vegetation, carbon cycles etc.), but these models are still very much a work in progress and have not been used extensively for paleo-climatic purposes. Some initial attempts have been made for select feedbacks and forcings (Gerber et al, 2003; Goosse et al 2006) but a comprehensive assessment over the millennia prior to the pre-industrial does not yet exist.

Even for those forcings for which good records exist, there is a question of they are represented within the models. This is not so much of an issue for the well-mixed greenhouse gases (CO₂, N₂O, CH₄) since there is a sophisticated literature and history of including them within models (IPCC, 2001) though some aspects, such as minor short-wave absorption effects for CH₄ and N₂O are still not universally included (Collins et al, 2006). However, solar effects have been treated in quite varied ways.

The most straightforward way of including solar irradiance effects on climate is to change the solar 'constant' (preferably described as total solar irradiance - TSI). However, observations show that solar variability is highly dependent on wavelength with UV bands having about 10 times as much amplitude of change than TSI over a solar cycle (Lean, 2000). Thus including this spectral variation for all solar changes allows for a slightly different behaviour (larger solar-induced changes in the stratosphere where the UV is mostly absorbed for instance). Additionally, the changes in UV affect ozone production in both the stratosphere and troposphere, and this mechanism has been shown to affect both the total radiative forcing and dynamical responses (Haigh 1996, Shindell et al 2001; 2006). Within a chemistry climate model this effect would potentially

modify the radiative impact of the original solar forcing, but could also be included as an additional (parameterised) forcing in standard GCMs.

There is also a potential effect from the indirect effect of solar magnetic variability on the shielding of cosmic rays, which have been theorised to affect the production of cloud condensation nuclei (Dickinson, 1975). However, there have been no quantitative calculations of the magnitude of this effect (which would require a full study of the relevant aerosol and cloud microphysics), and so its impact on climate is not (yet) been included.

Large volcanic eruptions produce significant amounts of sulphur dioxide (SO₂). If this is injected into the tropical stratosphere during a particularly explosive eruption, the resulting sulphate can persist in the atmosphere for a number of years (e.g. Pinatubo in 1991). Less explosive, but more persistent eruptions (e.g. Laki in 1789??) can still affect climate though in a more regional way and for a shorter term (Oman et al, 2005). These aerosols have both a shortwave (reflective) and longwave (absorbing) impact on the radiation and their local impact on stratospheric heating can have important dynamical effects. It is therefore better to include the aerosol absorber directly in the radiative transfer code. However, in less sophisticated models, the impact of the aerosols has been parameterised as the equivalent decrease in TSI. For extreme eruptions it has been hypothesised that sulphate production might saturate the oxidative capacity of the stratosphere leaving significant amounts of residual SO₂. This gas is a greenhouse gas and would have an opposite effect to the cooling aerosols. This effect however has not yet been quantified.

Land cover changes have occurred both due to deliberate modification by humans (deforestation, imposed fire regimes, agriculture) as well as a feedback to climate change (the desertification of the Sahara ca. 5500 yrs ago). Changing vegetation in a standard model affects the seasonal cycle of albedo, the surface roughness, the impact of snow, evapotranspiration (through different rooting depths) etc. However, modelling of the yearly cycle of crops, or incorporating the effects of large scale irrigation are still very much a work in progress.

Aerosol changes over the last few millennia are very poorly constrained (if at all). These might have arisen from climatically or human driven changes in dust emissions, ocean biology feedbacks on circulation change,

or climate impacts on the emission volatile organics from plants (which also have an impact on ozone chemistry). Some work on modelling a subset of those effects has been done for the last glacial maximum or the 8.2 kyr event (LeGrande et al, 2006), but there have been no quantitative estimates for the late Holocene (prior to the industrial period).

Due to the relative expense of doing millennial simulations with state-of-the-art GCMs, existing simulations have generally done the minimum required to include relevant solar, GHG and volcanic forcings. Progress can be expected relatively soon on more sophisticated treatments of those forcings and the first quantitative estimates of additional effects.

Hi Phil,

Off travelling again, will check in when I return next week on status of Perugia (arggh!). Papers is looking good. I've attached draft of Mann et al (2007) which should have the references you're looking for. Please don't distribute, we'd like to wait until galleys are available to begin distributing the paper.

One small thing, this statement at end of 1st paragraph on page 18 in the draft didn't seem appropriate:

The question of whether the proxies used by MBH98 were themselves subject to amplitude limitations is not the focus of this section, and is examined in Section 2 above.

These issues are implicit in section 2, but have nothing to do w/ MBH98 specifically. As written this is misleading/confusing, and I don't think it adds anything.

Phil Jones wrote:

Dear All,

There has been some progress. I have contributions from Gene and Gavin. Keith (2.3) and Tim (3) here in CRU tell me they are working on their parts. Francis (5) also tells me he has also started. Tas told me about 6 weeks ago he would finish the ice core part (section 2.3) shortly.

So we are getting there. I still need input from Caspar (section 4), Nick (section 2.6), Peck (section 2.5). I have added in the section names of the missing sections to help you all along.

Also need people to begin reading through the whole paper, but this is premature yet.

I saw Thorsten at the EGU and he emailed recently saying that Larry (EPRI) is keen to see this submitted soon. Remember it was through PAGES and EPRI support that we had such a great few days in Wengen almost a year ago!

If we all put some effort in over June we could be there.

Can Gene and Gavin send me their references when they have a few minutes. I suspect most will be in Mann et al. (2007), so if I can get that I can add them in. I won't pass this on to any others.

Cheers

Phil

thanks Phil,

yeah, I figured we might as well wait until all contributions have been received before going over the full text and making necessary revisions...

off to Oregon now. talk to you later,

mike

Mike,

Thanks for the paper. Gene wrote that bit. I'll flag it for modifying at my next draft - when I get a chance to add the refs in. Likely the weekend. May have got some other responses by then.

Cheers

Phil

Thanks Phil,

We R now responding to a former TV weather forecaster who has got press, He has a web site of 40 of the USHCN stations

showing less than ideal exposure. He claims he can show urban biases and exposure biases.

We are writing a response for our Public Affairs. Not sure how it will play out.

Regards, TOM

Phil Jones said the following on 6/19/2007 4:22 AM:

Wei-Chyung and Tom,

The Climate Audit web site has a new thread on the Jones et al. (1990) paper, with lots of quotes from Keenan. So they may not be going to submit something to Albany. Well may be?!?

Just agreed to review a paper by Ren et al. for JGR. This refers to a paper on urbanization effects in China, which may be in press in J. Climate. I say 'may be' as Ren isn't that clear about this in the text, references and responses to earlier reviews. Have requested JGR get a copy a copy of this in order to do the review.

In the meantime attaching this paper by Ren et al. on urbanization at two sites in China.

Nothing much else to say except:

1. Think I've managed to persuade UEA to ignore all further FOIA requests if the people have anything to do with Climate Audit.
2. Had an email from David Jones of BMRC, Melbourne. He said they are ignoring anybody who has dealings with CA, as there are threads on it about Australian sites.
3. CA is in dispute with IPCC (Susan Solomon and Martin Manning) about the availability of the responses to reviewer's at the various stages of the AR4 drafts. They are most interested here re Ch 6 on paleo.

Cheers

Phil

Dr. Keenan,

The only valid scientific issue described in your June 11, 2007 e-mailed pdf file (attached here as reference) concerning our 1990 GRL paper is the "station histories", while others are strictly your own opinions and therefore irrelevant to your inquiry. So let me elaborate further on this issue.

Digitization of the hard copies of "station histories" was prepared in 1989-90 by Ms. Zhao-Mei Zeng (IAP/CAS) only for the 60-station network, while the "station histories" of other stations, including those we used in 1990 urban warming study, were available in paper form, as I have already indicated in my 4/30/07 e-mail to you. Therefore, the use of the word "fabrication" in your document is totally absurd.

Concerning the current status of these hard copies of "station histories", Ms. Zeng told me when I was in Beijing in April 2007, that she no longer has the access to these information because it has been a long time (since 1990) and also IAP has moved office. But if you are interested, you can make an inquiry to the China Meteorological Administration using the web site:

[4]<http://211.147.16.25/ywwz/about/cma.php>.

I believe that I have made it very clear what we had done with regard to the "station histories" in 1990 urban warming study. What and how you are going to proceed from now on is entirely your decision.

Dear Dr. Wang,

I had something urgent arise, and so had to leave this matter for a while.

Please find attached a rough draft report. If you believe the report to be inaccurate or misrepresentative, kindly let me know.

I hope that you will reconsider. If you decide to publish retractions, I will cease to bring this forward.

Sincerely,

Douglas Keenan

Fascinating. Thanks for keeping me in the loop, Phil. I won't pass it on but I will keep it in the back of my mind when/if Russ asks about appropriate responses to CA requests. Russ' view is that you can never satisfy them so why bother to try?

It seems to me that what they are saying is the equivalent of accusing a doctor of malpractice for not seeing a broken bone in a Chinese x-ray taken in 1985 when the break is clearly visible in a state of the art 2005 Canadian MRI scan examined while wearing their special problem finding glasses.

They also don't seem to understand the collaborative nature of the work, equivalent to accusing you of faulty reading of metadata at the USHCN station in Reno because you quoted a general USHCN statement that wasn't fully applicable to Reno.

Good luck.

Tom

Phil Jones said the following on 6/20/2007 3:59 AM:

Tom P.

Just for interest. Don't pass on.

Might be a precedent for your paper to J. Climate when it comes out.

There are a few interesting comments on the CA web site.

One says it is up to me to prove the paper from 1990 was correct, not for Keenan to prove we're wrong. Interesting logic.

Cheers

Phil

Wei-Chyung, Tom,

I won't be replying to either of the emails below, nor to any of the accusations on the Climate Audit website.

I've sent them on to someone here at UEA to see if we should be discussing anything with our legal staff.

The second letter seems an attempt to be nice to me, and somehow split up the original author team.

I do now wish I'd never sent them the data after their FOIA request!

Cheers

Phil

Dear Phil,

Jones et al 1990 cited a 260-station temperature set jointly collected by the US Department of Energy and the PRC Academy of Sciences, stating in respect to the Chinese stations:

The stations were selected on the basis of station history: we chose those with few, if any, changes in instrumentation, location or observation times.

This data set was later published as NDP-039

[3]<http://cdiac.ornl.gov/epubs/ndp/ndp039/ndp039.html> , coauthored by Zeng Zhaomei, providing station histories only for their 65-station network, stating that station histories for their 205-station network (which includes many of the sites in Jones et al 1990) were not available:

(s. 5) Unfortunately, station histories are not currently available for any of the stations in the 205-station network; therefore, details regarding instrumentation, collection methods, changes in station location or observing times, and official data sources are not known.

(s. 7) Few station records included in the PRC data sets can be considered truly homogeneous. Even the best stations were subject to minor relocations or changes in observing times, and many have undoubtedly experienced large increases in urbanization. Fortunately, for 59 of the stations in the 65-station network, station histories (see Table 1) are available to assist in proper interpretation of trends or jumps in the data; however, station histories for the 205-station network are not available. In addition, examination of the data from the 65-station data set has uncovered evidence of several undocumented station moves (Sects. 6 and 10). Users should therefore exercise caution when using the data.

Accordingly, it appears that the quality control claim made in Jones et al 1990 was incorrect. I presume that you did not verify whether this claim was correct at the time and have been unaware of the incorrectness of this representation. Since the study continues to be relied on, most recently in AR4, I would encourage you to promptly issue an appropriate correction.

Regards, Steve McIntyre

X-UEA-Spam-Score: 0.0

X-UEA-Spam-Level: /

X-UEA-Spam-Flag: NO

Steve,

I thought that I should summarize what has happened with the Wang case.

First, I concluded that the claims made about Chinese stations by Jones et al. [Nature, 1990] and Wang et al. [GRL, 1990] were very probably fabricated. (You very likely came to the same conclusion.)

Second, some investigation showed that Phil Jones was wholly blameless and that responsibility almost certainly lay with Wang.

Third, I contacted Wang, told him that I had caught him, and asked him to retract his fabricated claims. My e-mails were addressed to him only, and I told no one about them. In Wang's reply, though, Jones, Karl, Zeng, etc. were Cc'd.

Fourth, I explained to Wang that I would publicly accuse him of fraud if he did not retract. Wang seemed to not take me seriously. So I drafted what would be the text of a formal accusation and sent it to him. Wang replied that if I wanted to make the accusation, that was up to me.

Fifth, I put a draft on my web site--

[7] <http://www.informath.org/apprise/a5620.htm>

--and e-mailed a few people, asking if they had any recommendations for improvement.

I intend to send the final version to Wang's university, and to demand a formal investigation into fraud. I will also notify the media. Separately, I have had a preliminary discussion with the FBI--because Wang likely used government funds to commit his fraud; it seems that it might be possible to prosecute Wang under the same statute as was used in the Eric Poehlman case. The simplicity of the case makes this easier--no scientific knowledge is required to understand things.

I saw that you have now e-mailed Phil (Cc'd above), asking Phil to publish a retraction of Wang's claims: [8]<http://www.climateaudit.org/?p=1741#comment-115879>

There could be a couple problems with that. One problem is that it would be difficult for Phil to publish anything without the agreement of Wang and the other co-authors (Nature would simply say "no").

Another problem is that your e-mail says that you presume Phil was "unaware of the incorrectness" of Wang's work. I do not see how that could be true. Although the evidence that Phil was innocent in 1990 seems entirely conclusive, there is also the paper of Yan et al. [Advances in Atmospheric Sciences, 18: 309 (2001)], which is cited on my web page. Phil is a co-author of that paper.

Phil, this proves that you knew there were serious problems with Wang's claims back in 2001; yet some of your work since then has continued to rely on those claims, most notably in the latest report from the IPCC. It would be nice to hear the explanation for this. Phil?

Kind wishes, Doug

Hang in there. I went thru this on the hurricane stuff and it was hard to take. But responding to these guys unless they write papers is not the thing to do.

Hi Phil:

Glad I can help, even if quite indirectly. I know what you mean about the need for community when under duress. The individual quality of being a scientist works against us in this way. Attached are the original letter and the official UCAR response. I don't know what the lawyers might have written, other than their input to the official response letter. I do know they sought information from Caspar (and myself, but less so). I don't recall if we made available to them our correspondence with Steve Schneider about our responses to the review of WA that McIntyre did, which had a lot of information in it that debunked his claims about withholding contrary results, etc, etc.. In fact, we have never mentioned this to Steve, to make sure that he was in the situation to make editorial decisions as focused solely on the science as possible.

I was wondering if there is any way we as the scientific community can seek some kind of "cease and desist" action with these people. They are making all kinds of claims, all over the community, and we act in relatively disempowered ways. Note that UCAR did send the response letter to the presidents of the two academic institutions with which MM are associated, although this seems to have had no impact. Seeking the help of the attorneys you speak about would be useful, I should think. I know that Mike has said he looked into slander action with the attorneys with whom he spoke, but they said it is hard to do since Mike is, in effect, a "public" person -- and to do so would take a LOT of his time (assuming that the legal time could somehow be supported financially). If I might ask, if you do get legal advice, could you inquire into the possibility of acting proactively in response via the British system? Maybe the "public" person situation does not hold there, or less so. I only ask you to consider this question on my part; obviously, please do what you deem best for your situation.

Finally, I have shared the MM letter and UCAR response before only with one other scientist, a now retired eminent person here in the US whom I asked to look over all the materials and give me his frank opinion if he felt we had done anything inappropriate. He came back with a solid "NO", and said that what MM were attempting was "unspeakable". Caspar has mentioned that UCAR said to him they did not want to disseminate these materials publically, and I have kept to that, other than the case mentioned. It seems clear to me that providing them to you is appropriate; I have not contacted Caspar to think about it at this point, and don't feel I need to. Anyway, this is just to give you the context on that side of things. I would imagine that sharing the doc's with legal persons you trust would be OK.

Note that I am now out of contact through July 9. I wish you all the best!!

Peace, Gene

Subject: Fwd: Jones et al 1990

Gene,

Thanks for the email of support! I've taken up the idea of asking someone at UEA about legal advice.

I would like to see the original letter if possible. I won't pass this on. Did the NCAR/UCAR legal staff put anything in writing, as this might help me decide if the advice I might get here is reasonable? I'm sure it will be and I know I've nothing to worry about, as I've done nothing wrong and neither has Wei-Chyung.

It is good to share these sorts of things with a few people. I know Ben and Mike have been through this, but wasn't aware you and Caspar had. Thanks for your strength !

Cheers
Phil

Wei-Chyung, Tom,

I won't be replying to either of the emails below, nor to any of the accusations on the Climate Audit website.

I've sent them on to someone here at UEA to see if we should be discussing anything with our legal staff.

The second letter seems an attempt to be nice to me, and somehow split up the original author team.

I do now wish I'd never sent them the data after their FOIA request!

Cheers
Phil

Dear Phil,

Jones et al 1990 cited a 260-station temperature set jointly collected by the US Department of Energy and the PRC Academy of Sciences, stating in respect to the Chinese stations:

The stations were selected on the basis of station history: we chose those with few, if any, changes in instrumentation, location or observation times.

This data set was later published as NDP-039 <http://cdiac.ornl.gov/epubs/ndp/ndp039/ndp039.html> , coauthored by Zeng Zhaomei, providing station histories only for their 65-station network, stating that station histories for their 205-station network (which includes many of the sites in Jones et al 1990) were not available:

(s. 5) Unfortunately, station histories are not currently available for any of the stations in the 205-station network; therefore, details regarding instrumentation, collection methods, changes in station location or observing times, and official data sources are not known.

(s. 7) Few station records included in the PRC data sets can be considered truly homogeneous. Even the best stations were subject to minor relocations or changes in observing times, and many have undoubtedly experienced large increases in urbanization. Fortunately, for 59 of the stations in the 65-station network, station histories (see Table 1) are available to assist in proper interpretation of trends or jumps in the data; however, station histories for the 205-station network are not available. In addition, examination of the data from the 65-station data set has uncovered evidence of several undocumented station moves (Sects. 6 and 10). Users should therefore exercise caution when using the data.

Accordingly, it appears that the quality control claim made in Jones et al 1990 was incorrect. I presume that you did not verify whether this claim was correct at the time and have been unaware of the incorrectness of this representation. Since the study continues to be relied on, most recently in AR4, I would encourage you to promptly issue an appropriate correction.

Regards, Steve McIntyre

X-UEA-Spam-Score: 0.0
X-UEA-Spam-Level: /
X-UEA-Spam-Flag: NO

Steve,

I thought that I should summarize what has happened with the Wang case.

First, I concluded that the claims made about Chinese stations by Jones et al. [Nature, 1990] and Wang et al. [GRL, 1990] were very probably fabricated. (You very likely came to the same conclusion.)

Second, some investigation showed that Phil Jones was wholly blameless and that responsibility almost certainly lay with Wang.

Third, I contacted Wang, told him that I had caught him, and asked him to retract his fabricated claims. My e-mails were addressed to him only, and I told no one about them. In Wang's reply, though, Jones, Karl, Zeng, etc. were Cc'd.

Fourth, I explained to Wang that I would publicly accuse him of fraud if he did not retract. Wang seemed to not take me seriously. So I drafted what would be the text of a formal accusation and sent it to him. Wang replied that if I wanted to make the accusation, that was up to me.

Fifth, I put a draft on my web site--

<http://www.informath.org/apprise/a5620.htm>
<<http://www.informath.org/apprise/a5620.htm>> --and e-mailed a few people, asking if they had any recommendations for improvement.

I intend to send the final version to Wang's university, and to demand a formal investigation into fraud. I will also notify the media. Separately, I have had a preliminary discussion with the FBI--because Wang likely used government funds to commit his fraud; it seems that it might be possible to prosecute Wang under the same statute as was used in the Eric Poehlman case. The simplicity of the case makes this easier--no scientific knowledge is required to understand things.

I saw that you have now e-mailed Phil (Cc'd above), asking Phil to publish a retraction of Wang's claims:

<http://www.climateaudit.org/?p=1741#comment-115879>

There could be a couple problems with that. One problem is that it would be difficult for Phil to publish anything without the agreement of Wang and the other co-authors (Nature would simply say "no").

Another problem is that your e-mail says that you presume Phil was "unaware of the incorrectness" of Wang's work. I do not see how that could be true. Although the evidence that Phil was innocent in 1990 seems entirely conclusive, there is also the paper of Yan et al. [Advances in Atmospheric Sciences, 18: 309 (2001)], which is cited on my web page. Phil is a co-author of that paper.

Phil, this proves that you knew there were serious problems with Wang's claims back in 2001; yet some of your work since then has continued to rely on those claims, most notably in the latest report from the IPCC. It would be nice to hear the explanation for this. Phil?

Kind wishes, Doug

Malcolm,

Thanks for that, much appreciated.

I'll forward it on to Gil Compo and others linked to ACRE and the AOPC WGs. I think that Roger Stone from Queensland knows some of your people, so there should be some good links all round.

I've also gone back to Howard Diamond, the US GCOS Rep, from whom I'm hoping to get some financial support for such a meeting to gauge his reaction to holding it in Europe.

Cheers, Rob.

To: Keith Briffa <k.briffa@uea.ac.uk>, Tom Melvin <t.m.melvin@uea.ac.uk>
Subject: Re: AD 536
Date: Tue, 3 Jul 2007 17:52:39 +0600
Reply-to: Rashit Hantemirov <rashit@ipae.uran.ru>

Dear Keith and Tom,
thank you to include me in co-authors list of the paper.
I'm not sure that it is right, nevertheless I can't refuse. However,
if you consider to reduce number of co-authors I would not be offended
if you exclude me.

My corrections and suggestions:

1) Table S1: for Yamal - elevation 10-60 m, east - 70°, north - 67°30'

2) may be add reference to presence of frost rings in AD 536 in
Siberian pine in Mongolia (D'Arrigo et al., Climatic change, 49,
239-246, 2001) and frost and light rings in larch from Yamal (our
data)?

3) if possible, add to acknowledgments my thanks for funding to
Russian Foundation for Basic Research (project # 07-05-00989)

4) just to satisfy my curiosity - if dating of ice layers is not too
precise, why not suppose that first peak of sulphate deposits (about
AD 529 in fig. 3b) correspond to AD 536? May be two eruptions are
reason of relative long growth suppression? By the way, in larch from
Yamal frost rings formed in 536, 543 (two times as much as 536), and
545 (previous frost rings year was AD 404, next AD 627).

I'm sorry, I didn't reply to your previous letter concerning
manuscript to Philosophical Transactions of Royal Society. If it is
not too late, please correct my name in co-authors list (Rashit).

Best regards

Thanks to Tim and Keith for that correction.

I've inserted that, and also reworded the paragraph in the conclusions which talked about "serious flaws" along the lines suggested by Tim. It now reads:

"The IPCC2001 conclusion that temperatures of the past millennium are unlikely to have been as warm, at any time prior to the 20th century, as the last decades of the 20th century is supported by subsequent research and by the results obtained here.

We have also reviewed and, in some cases, tested with new analysis, papers which claim to refute that IPCC2001 conclusion and found that their claims are not well supported."

This version attached with the revised supplementary material.

I need to go over the `changes' document again, and the response, but I hope to send it in on Monday.

cheers,

Martin

Geoff,

David is essentially right. In 1986 we rejected 38 (if my memory from 1986) is correct! I don't recall the number we looked at so I can't give a percentage, as I'm not that much of a trainspotter.

The % would be small though, as we looked the homogeneity of about 2500 then. Also some which might have been affected by urbanization might have been rejected for other reason. I'm half asleep here in my hotel room in Beijing (same hotel as the IPCC meeting David!) as it is just gone 8pm! I have the pdf of the 1986 paper and 38 rejected for urban warming trends (31 in N. America and 7 in Europe - none elsewhere) out of 2666. 239 were rejected for other reasons.

Brohan et al is the best reference. We included urbanization as one of the biases (one sided as urban should lead to warming, so if you look very, very closely at the error range in the paper you'll see it is slightly one-sided.

I've been giving some talks here and have more tomorrow. At CMA I've found they have a homogenized dataset of 745 stations for the country which they are preapred to give me at some point for inclusion. They have adjusted for all site moves but not for urbanization. It seems that it is almost impossible for sites here to be rural (maybe only 1% of the total). Sites move out of the city at regular intervals as the cities expand. So Beijing has 6-7 site moves since 1951! Also China seems to be the only country that doesn't use airport sites. None are located at airports. I'm going to give them my Chinese sites in return so they can do some comparisons. I'll talk with their person (Mr Li) more tomorrow.

Another interesting bit of work here is that they also have an homogenized set of monthly wind speed data from 1951. Not sure how they homogenize this for site moves, but almost all the sites (about 200) show declines in mean wind speeds since 1951. NCEP and ERA-40 also show this for wind speeds at 1000, 925 and 850hPa as well. Odd thing is that they think the decline in wind speeds is due to urbanization! - Li's English isn't great though, so I could be wrong. Another person I've been talking to has been looking at precip trends from 1951 - again they think declines in N. China are due to urbanization! Odd then that there are increases in S. China, which is also urbanized at similar rates.

Air quality here is awful - I saw the sun for the first time since arrival on Sunday, after a long downpour cleared the air this morning! The haze will be back tomorrow. Apparently they will closing the worst factories and getting half the cars off the road next August for the Olympics! Traffic might flow better for the latter, but can't see the former doing that much good. What they need to do is to get a heavy downpour every early morning!

Cheers

=====

This is awful stuff and I can't imagine that this could be published. I know of this fellow Peiser though and he is extremely biased (against you likely). So treading with caution is warranted. The email seems to invite a comment but not a review. You should probably only respond with something that you would not mind being published. You can also point out errors of fact. Whether you point out errors of logic or opinion is another matter altogether. If you write just to the editor you can try to evaluate the comment and point out that it lacks substance.

I think my approach would be to try to stick to science.e.g.

I don't know what was done for the 1990 paper but obviously sound practice is

- 1) we attempt to use homogeneous data
- 2) Site moves are one indication of lack of homogeneity but there are standard means of adjusting for such moves especially when there is an overlap in the record.
- 3) All data are scrutinized for possible problems and discontinuities, especially if there is a question about a possible move and the date is known.
- 4) Site movements do not necessarily prejudice the record toward warming or cooling: a move from the inner city to an outlying airport can result in cooling, for instance.
- 5) Revisions are made when new information becomes available.
- 6) It is helpful if researchers can improve the records and provide updated analyses.

Or something to this effect. You could try a patronizing approach of over explaining the difficulties.

At the very least you should be critical of the statement in 4. that he "politely requested an explanation". He quotes you as saying:

"Why should I make the data available to you, when your aim is to try and find something wrong with it?".[1][1]

[2][1] McIntyre S. (19 July 2006), Submission to the Subcommittee on Oversight and Investigations (Committee on Energy and Commerce, U.S. House of Representatives). This is a sworn statement by McIntyre. [It is available at
[3]<http://energycommerce.house.gov/reparchives/108/Hearings/07192006hearing1987/McIntyre.pdf>.]

but you have no reason to be defensive: if there was a problem with the data and all due care was taken, then if there is something wrong with it, it was the responsibility of those who took the data, not those who used it responsibly. You should also point out that the data are just as available to anyone as to you.

In the IPCC report we are careful to say that there are urban effects and they are important and we have a lot about them. But they are small on the global scale. His conclusions are wrong. Also the IPCC evaluates published works and does not do research or deal with raw data.

In the appendix, presumably the quotes are based on the best information at the time. That was then.

The conclusions of the author that fabrication occurred is not valid. Maybe things could have been done better, but that universally applies.

Let me know if you want more concrete suggestions

Kevin

Phil Jones wrote:

Kevin, Mike,

Sending just for your thoughts. The Appendix of this attachment has gone to SUNY Albany and is being dealt with by them. Not sure when, but Wei-Chyung has nothing to worry about.

I've sent to Wei-Chyung and also to Tom Karl. Q is should I respond? If I don't they will misconstrue this to suit their ends. I could come up with a few sentences pointing out the need to look at the Chinese data rather than just the locations of the sites. Looking further at Keenan's web site, he's not looked at the temperature data, nor realised that the sites he's identified are the urban stations from the 1990 paper. He has no idea if the sites for the rural Chinese stations moved, as he doesn't seem to have this detail. Whatever I say though will be used for whatever, so it seems as though I'm damned if I do and damned if I don't.

Does the email suggest to you this is a request for a formal review?

E&E have an awful track record as a peer-review journal.

Footnote 8 is interesting. Grape harvest dates are one of the best documentary proxies.

Cheers

Phil

Dear Dr Jones

I have attached a copy of Doug Keenan's paper on the alleged Wang fraud that was submitted for the forthcoming issue of Energy & Environment

[6]<http://www.ingentaconnect.com/content/mscp/ene>.

I was wondering whether you would be happy to comment on its content and factual accuracy. Your comments and suggestions would be much appreciated. We would need your feedback by Sept 17.

I look forward to hearing from you.

Yours sincerely

Benny Peiser

thanks Phil,

I did take the liberty of discussing w/ Gavin, who can of course be trusted to maintain the confidentiality of this. We're in agreement that Keenan has wandered his way into dangerous territory here, and that in its current form this is clearly libellous; there is not even a pretense that he is only investigating the evidence. Furthermore, while many of us fall under the category of 'limited public figures' and therefore the threshold for proving libel is quite high, this is **not** the case for Wei-Chyung. He is not a public figure. I believe they have made a major miscalculation here in treating him as if he is. In the UK, where E&E is published, the threshold is even lower than it is in the states for proving libel. We both think he should seek legal advice on this, as soon as possible.

With respect to Peiser's guest editing of E&E and your review, following up on Kevin's suggestions, we think there are two key points. First, if there are factual errors (other than the fraud allegation) it is very important that you point them out now. If not, Keenan could later allege that he made the claims in good faith, as he provided you an opportunity to respond and you did now. Secondly, we think you need to also focus on the legal implications. In particular, you should mention that the publisher of a libel is also liable for damages - that might make Sonja B-C be a little wary. Of course, if it does get published, maybe the resulting settlement would shut down E&E and Benny and Sonja all together! We can only hope, anyway. So maybe in an odd way its actually win-win for us, not them. Lets see how this plays out...

RealClimate is of course always available to you as an outlet, if it seems an appropriate venue. But we should be careful not to jump the gun here.

Kevin: very sorry to hear about Dennis. Please pass along my best wishes for a speedy recovery if and when it seems appropriate to do so...

Mike

Phil,

I think you need to respond by providing E&E with a simple answer of "false" to Keenan's write-up, based on the communication with me (but no mention of SUNYA confidentiality issue, it has to come directly from SUNYA). That will force E*E to contact either me directly or SUNYA. If the former, I can refer to SUNYA also, and let the university to handle it.

My reading is that, since the IPCC policy report is coming out soon (in October?), Keenan is in panic and wants to tint the Nature paper as much and as soon as possible, so he can not wait for SUNYA to conduct "inquiry" (not investigation) which he knows he is not getting what he wants. Going to news medium will not do his trick because he can not really explain it. So in a way Keenan traps himself now, betting on that the "station history" was not available and that the stations have moved a lot (he does not know that at all). We are facing a tricky person and group, and the only way to do it is to follow the procedure to drive them crazy. E&E is not going to publish it without giving me the chance to respond, and that is when SUNYA comes in and that is what Keenan does not want to see as well, he wants to create a smocky screen before the truth comes out. We are not going to let Keenan doing things his way. So be easy, and respond directly what you learn from me (and any other scientific issues you can identify) and perhaps even ask E&E to contact me/or SUNYA for verification.

I know you are under tremendous pressure, but Keenan is in panic and what he has done is going back to burn him, badly. We should be thinking, after the whole ordeal is over, to take legal (or other) actions against Keenan. This is time I regret not been a rich person, otherwise I can throw a million dollar lawsuit against him.

Let me know what you want to do. I have also asked SUNYA's opinion about what you should do within the SUNYA framework. But be careful that you do not know much about SUNYA action.

WCW

Phil,

Seems to me that Keenan has a valid point. The statements in the papers that he quotes seem to be incorrect statements, and that someone (WCW at the very least) must have known at the time that they were incorrect.

Whether or not this makes a difference is not the issue here.

Tom.

Phil,

sorry, first version of my message was a bit garbled. Here is the full message:

thanks for forwarding. It may be difficult for me to sue them over a footnote, and in fact he is very careful only to intimate accusations against me in a response to your comments. Note that he does not do so in the paper. I'm sure they know that I would sue them for that, and that I have a top lawyer already representing me.

Wei Chyung needs to sue them, or at the least threaten a lawsuit. If he doesn't, this will set a dangerous new precedent. I could put him in touch w/ anleading attorney who would do this pro bono. Of course, this has to be done quickly. The threat of a lawsuit alone my prevent them from publishing this paper, so time is of the essence. Please feel free to mention this directly to Wei Chyung, in particular that I think he needs to pursue a legal course her independent of whatever his university is doing. He cannot wait for Stony Brook to complete its internal investigations! If he does so, it will be too late to stop this.

Gavin is in Shanghai, but perhaps may be able to provide some brief thoughts himself on this,

mike

Subject: Possible problem looming

Jacquie,

I've been in discussion with Michael over the past several months about a number of Freedom of Information (FOI) requests for CRU data. I've responded to one and will be responding to another in the next few days. Michael suggested I bring you up to speed on the issue. To cut a very long story short, I'm attaching 3 things that relate to what's happened since responding to the first request.

1. A paper from 1990 by me and others in Nature. The request was for the station data from the rural station networks in the three regions studied.

This led to a person in London (Douglas Keenan) putting some material on his website claiming fraud against one of the co-authors on the paper (Wei-Chyung Wang of the State University of Albany, SUNY, in NY, USA). He then put an allegation of fraud into SUNY against Wang. SUNY are dealing with this - not quickly, but I have seen Wang's response.

2. Keenan then submitted a paper (attached) to the world's worst journal,

Energy and Environment. According to Wang this is in breach of an agreement

with SUNY not to do anything whilst the allegation is being dealt with.

According to Wang, SUNY have told Keenan this.

I was sent the paper to comment on the factual allegations in the paper. After

discussing this with Wang (who informed SUNY) I sent 9 comments.

3. My comments - with Keenan's responses embedded within (this is the new bit for you Michael).

I have subsequently told the E&E guest editor that Keenan's response to my point

5 is wrong. I sent him Tao et al. (1991) so he can see this. Keenan's response to my point 7

illustrates his arrogance.

I have loads more background to all this, and it has taken some time over the

last few weeks and months in responding.

You are now partly up to speed on the issue. I'm away next week. I don't know when E&E might publish, nor when the SUNY review process (which is being dealt with by their Director of Research) will conclude. Wang and I both know that the allegations are groundless, but it is likely it will not look good when it first comes out. This is just

another of the attempts by climate skeptics to get the public and the media thinking that there is disagreement amongst scientists and that we shouldn't be doing anything about global warming. I will be discussing

this with some IPCC people when I meet them in early October.

Cheers

Phil

Phil,

Thanks for forwarding this. I am shocked about this - if a formal review

is underway at the University of Albany it is surely improper to publish a paper in a journal about the matter!

I suggest that you alert Jacquie Burgess to this, as the new Head of School.

I would like to suggest that we ask Dave Palmer to comment on the events on the FOIA request - I don't think I fully agree with the story presented here. Do you agree?

I also think we should alert the Press Office in due course.

Regards

Michael

From: "Wahl, Eugene R" <wahle@alfred.edu>
To: "Jonathan Overpeck" <jto@u.arizona.edu>
Subject: RE: Wahl & Ammann AND Ammann & Wahl papers
Date: Thu, 13 Sep 2007 18:34:11 -0400
Cc: "Eystein Jansen" <eystein.jansen@geo.uib.no>, <t.osborn@uea.ac.uk>, "Keith Briffa" <k.briffa@uea.ac.uk>

Hello Peck, Eystein, Tim, Keith:

Please find attached the e-versions of the WA and AW papers re: the "hockey-stick". These are now available as "to-come-in-print" articles from Climatic Change. I believe the WA one was just loaded yesterday. As I understand it, official "print" publication will be this November. These versions HAVE gone through the author proof process, and thus I anticipate no possibility of them being further changed before print publication.

Note brief correspondence yesterday with Phil Jones re: proof-level changes that were made to WA (copied below).

Peace, Gene

Sent: Wednesday, September 12, 2007 6:44 PM
To: 'Phil Jones'; Caspar Ammann
Subject: RE: Wahl/Ammann

Hi Phil:

There were inevitably a few things that needed to be changed in the final version of the WA paper, such as the reference to the GRL paper that was not published (replaced by the AW paper here), two or three additional pointers to the AW paper, changed references of a Mann/Rutherford/Wahl/Ammann paper from 2005 to 2007, and a some other very minor grammatical/structural things. I tried to keep all of this

to the barest minimum possible, while still providing a good reference structure. I imagine that MM will make the biggest issue about the very existence of the AW paper, and then the referencing of it in WA; but that was simply something we could not do without, and indeed AW does a good job of contextualizing the whole matter.

Steve Schneider seemed well satisfied with the entire matter, including its intellectual defensibility (sp?) and I think his confidence is warranted. That said, any other thoughts/musings you have are quite welcome.

Peace, Gene

Subject: Wahl/Ammann

Gene/Caspar,

Good to see these two out. Wahl/Ammann doesn't appear to be in CC's online first, but comes up if you search.

You likely know that McIntyre will check this one to make sure it hasn't changed since the IPCC close-off date July 2006!

Hard copies of the WG1 report from CUP have arrived here today.

Ammann/Wahl - try and change the Received date! Don't give those skeptics something to amuse themselves with.

Cheers

Phil

You should have seen the first version. I drafted that yesterday and then today toned it down. I did add a couple of points, including the link you suggested. Will try to send off later today but just to nature.com
Thanks
Kevin
Michael E. Mann wrote:

guys, I've got a few minutes before I have to head out again.
Kevin--thanks for helping return the Nature blog to respectability after a dubious start...I'd like to direct RealClimate readers to your piece as soon as it is up, so please let me know when that happens...
Looks like Phil has hit several of the key points, but here are a few more:
1. The 'discrediting' that Akasofu cites has been discredited. IPCC Chapter 6 rejected the McIntyre and McKittrick's claims in no uncertain terms, referencing the Wahl and Ammann work (reprints attached) who show that (a) the reconstruction is readily reproducible and (b) McIntyre and McKittrick only failed to reproduce the reconstruction because of multiple errors on their part. This is true in addition to the more general point that Kevin has made (that multiple independent studies confirm and in fact now extend the previous conclusions, rather than contradict them).
2. To the extent that the "LIA" and "MWP" can be meaningfully defined, there has been much work (published in Nature, Science, etc.) showing that the main variations (both in terms of hemispheric mean changes and spatial patterns) can indeed be explained in terms of the response of the climate system to natural radiative forcing changes (solar and volcanism). Only someone completely unfamiliar with the advances of the past ten years in climate science would claim that there are no explanations for these.
3. Continuing in this theme, to claim that the modern warming is some sort of 'rebound' reflects a thorough apparent lack of understanding of how the climate system works. The climate doesn't rebound. It responds (with some lag) to changes in radiative forcing. The

main patterns of variation of past centuries have been explained in terms of such responses to natural radiative forcing changes. As shown in countless studies, the late 20th century warming can only be explained in terms of the response to anthropogenic changes in radiative forcing. Kevin has more or less already made this point, in different words, in the current draft.

4. The bogus talking point that co2 lagging the warming in the ice cores has been debunked countless times before, and its an embarassment that it continues to be raised by one who ostensibly considers himself a scientist. This is total nonsense, and a nice refutation has been provided by Eric Steig on RealClimate here:

[1]<http://www.realclimate.org/index.php/archives/2007/04/the-lag-between-temp-and-co2/>
Perhaps worth just linking to that explanation?

Kevin, perhaps you're too gentle in attributing this simply to some 'confusion' about the facts. Either Mr. Akasofu has literally no familiarity whatsoever with the advances in climate science of the past two decades, or he has intentionally sought to deceive. In either case, his piece is embarassment.

Finally, let me withdraw my initial suggestion. For strategic reasons, it might make sense to submit this as letter to editor to WSJ (easy and quick to do online), and then publish it on the Nature blog in short order. I sea that as win-win because you can either call the WSJ for refusing to run your letter (which is very likely what will happen), or use the Nature blog piece to draw attention to your letter, should WSJ actually choose to publish your letter...

please don't hesitate to let me know if I can be of any further help here. Will be back online a bit later today,

mike

Phil Jones wrote:

Kevin,

A few quick thoughts. Article is awful as we all know.

It is important to learn about past climate change, especially over the past 1000 years, but it is even important to use new and improved evidence from proxy sources (i.e. not to cling to outdated concepts of the past such as the MWP and LIA). How can we ever hope to progress if we have conform to incorrect concepts?

On the early mid-20th century warming - look at the figures in Ch 9. The decrease from 1940-75 didn't happen if you look at global records. MBH was published in 1998 and wasn't just a tree-ring study. The Thames doesn't and never did freeze solid. It did so 25 times between 1400 and 1820. Only about 5-6 of these were frost fairs. Most of these have CET data, so what is the use of the freeze dates!

He plucks various figures out of the air!

I think the reductions in Arctic sea ice this summer/September are

alarming. They are 20% below the 2005 record. He comes from Alaska. Has he not seen the effects on the coast there?

Cheers

Date: Wed, 05 Dec 2007 11:37:40 -0500
Reply-to: mann@psu.edu

well put Phil,

I think you've put your finger right on it. JGR-Atmospheres has been publishing some truly awful papers lately; we responded (Gavin, me, James Annan) to the awful Schwartz sensitivity estimate paper, but there are so many other bad papers that are appearing there (Chylak, etc.) that its just impossible to respond to them all.

I hadn't seen this latest one though. McKitrick and Michaels team up again, wow! maybe McKitrick has figured ou the difference between radians and degrees this time!

talk to you later,

mike

Phil Jones wrote:

Mike,

Also I see him writing things - then people saying you should write this up for a paper, as though it can be knocked up in an afternoon. He realises he can't do this - as it takes much longer. Then we wastes more and more time opening up new threads. He doesn't seem clever enough to realise this.

Gavin and Rasmus have seen the attached piece of garbage! UAH is correct, therefore the land surface must be wrong. Let's adjust it for a dodgy reason - ah, it now agrees with UAH. Let's forget that the land now disagrees with the ocean surface. If only I'd thought of that first, I could have not bothered with the awful analysis. If only I'd just believed RSS in the first place.

Cheers

Phil

At 15:16 05/12/2007, you wrote:

HI Phil,

thanks--thats good.

Re, Loehle, McIntyre. Funny--w/ each awful paper E&E publishes, McIntyre realizes that it compromises the integrity of his own "work" even further. He can't distance himself from E&E much as he'd like to. He also seems to be losing lots of credibility now w/ all but his most loyal followers, which is good to see...

mike

Phil Jones wrote:

Mike,

Yes the 1990 graphic is in an Appendix. The last few are being regularly hassled by Thorsten. The guy from EPRI (Larry) really wants something submitted soon. So working here to get something in by end of Jan. Keith is going to get it fast-tracked through the Holocene - well that's the plan.

The Loehle paper is awful as you know. So is another article on the IPCC process in E&E. I did look at Climate Audit a week or two back - I got the impression that McIntyre is trying to distance himself from some of these E&E articles by saying we have to be equally skeptical about them as well.

Cheers

Phil

At 14:00 04/12/2007, you wrote:

Hey Phil,

thanks--nice coincidence in timing. So the 1990 graphic will be discussed in this review paper, right? Perfect, I'll let Gavin know.

Will look into the AGU fellowship situation ASAP.

I don't read E&E, gives me indigestion--I don't even consider it peer-reviewed science, and in my view we should treat it that way. i.e., don't cite, and if journalists ask us about a paper, simply explain its not peer-reviewed science, and Sonja B-C, the editor, has even admitted to an anti-Kyoto agenda!

I do hope that Wei-Chyung pursues legal action here.

So didn't see this recent paper, nor have I heard about the IJC paper, Christy and Spencer continue to lose more and more scientific credibility with each awful paper they publish.

Gavin is planning to do something on the Loehle paper on RealClimate, I'm staying away from it. I have a revised set of hemispheric reconstructions which I'll send you soon, its basically what I showed at AGU last year. Submitted to PNAS--more soon on that, mike

Phil Jones wrote:

Mike,

Some text came last night from Caspar. Keith/Tim writing their parts still. I have text from Francis, so almost all here now. Still need to find some time - maybe the Christmas/New Year break here - to put it all together. There is so much else going on here at the moment with other papers, it will be hard to find some time. I wish they had all responded much sooner!

As for AGU - just getting one of their Fellowships would be fine.

I take it you've seen the attached in E&E. I've not heard any more from Wei-Chyung in the past couple of months. I'm working on a paper on urbanization. I can show China is hardly affected. Will send for you to look over when I have it in a form that is sendable. Would appreciate

your thoughts on how I will have said things.

Have another awful pdf of a paper accepted in IJC !! It ws rejected by all three reviewers for GRL! It is by Douglass, Christy , Singer et al - thus you'll know what it is on.

Have booked flights for Tahiti in April, just need to do the hotel now.

Cheers

Phil

this reminds me. What's the status of Phil Jones and Caspar's investigation of the IPCC90 curve? Phil wanted us to hold off for some reason, but is that done with?

That's a great story that needs to be told.

Gavin

Dear folks,

Thank you very much for all of your emails, and my apologies for the delay in replying - I've been on travel for much of the past week.

Peter, I think you've done a nice job in capturing some of my concerns about the Douglass et al. paper. Our CCSP Report helped to illustrate that there were large structural uncertainties in both the radiosonde- and MSU-based estimates of tropospheric temperature change. The scientific evidence available at the time we were finalizing the CCSP Report - from Sherwood et al. (2005) and the (then-unpublished) Randel and Wu paper - strongly suggested that a residual cooling bias existed in the sonde-based estimates of tropospheric temperature change. As you may recall, we showed results from both the RATPAC and HadAT2 radiosonde datasets in the CCSP Report and the Santer et al. (2005) Science paper. From the latter (see, e.g., our Figure 3B and Figures 4C,D), it was clear that there were physically-significant differences between the simulated temperature trends in the tropical lower troposphere (over 1979 to 1999) and the trends estimated from RATPAC, HadAT2, and UAH data. In both the Science paper and the CCSP Report, we judged that residual biases in the observations provided the most likely explanation for these model-versus-data trend discrepancies.

Douglass et al. come to a fundamentally different conclusion, and ascribe model-versus-data differences to model error. They are not really basing this conclusion on new model data or on new observational data. The only "new" observational dataset that they use is an early version of Leo Haimberger's radiosonde dataset (RAOBCORE v1.2). Leo's dataset was under development at the time all of us were working on the CCSP Report and the Santer et al. Science paper. It was not available for our assessment in 2005. As Leo has already shared with you, newer versions of RAOBCORE (v1.3 and v1.4) show amplification of surface warming in the tropical troposphere, in reasonable agreement with the model results that we presented in Fig. 3B of our Science paper. Douglass et al. did not use these newer versions of RAOBCORE v1.2. Nor did Douglass et al. use any "inconvenient" observational datasets (such as the NESDIS-based MSU T2 dataset of Zou et al., or the MSU T2 product of Vinnikov and Grody) showing pronounced tropospheric warming over the satellite era. Nor did Douglass et al. discuss the "two timescale issue"

that formed an important part of our Science paper (i.e., how could models and multiple observational datasets show amplification behavior that was consistent in terms of monthly variability but inconsistent in terms of decadal trends?) Nor did Douglass et al. fairly portray results from Peter's 2007 GRL paper. In my personal opinion, Douglass et al. have ignored all scientific evidence that is in disagreement with their view of how the real world should be behaving.

I don't think it's a good strategy to submit a response to the Douglass et al. paper to the International Journal of Climatology (IJC). As Phil pointed out, IJC has a large backlog, so it might take some time to get a response published. Furthermore, Douglass et al. probably would be given the final word.

My suggestion is to submit (to Science) a short "update" of our 2005 paper. This update would only be submitted AFTER publication of the four new radiosonde-based temperature datasets mentioned by Peter. The update would involve:

- 1) Use of all four new radiosonde datasets.
- 2) Use of the latest versions of the UAH and RSS TLT data, and the latest versions of the T2 data from UAH, RSS, UMD (Vinnikov and Grody), and NESDIS (Zou et al.).
- 3) Use of the T2 data in 2) above AND the UAH and RSS T4 data to calculate tropical "TFu" temperatures, with all possible combinations of T4 and T2 datasets (e.g., RSS T4 and UMD T2, UAH T4 and UMD T2, etc.)
- 4) Calculating synthetic MSU temperatures from all model 20c3m runs currently available in the IPCC AR4 database. Calculation of synthetic MSU temperatures would rely on a method suggested by Carl (using weighting functions that depend on both the surface type [land, ocean] and the surface pressure at each grid-point) rather than on the static global-mean weighting function that we used previously. This is probably several months of work - but at least it will keep me off the streets and out of trouble.
- 5) Formal determination of statistical significance of model-versus-observed trend differences.
- 6) Brief examination of timescale-dependence of amplification factors.
- 7) As and both Peter and Melissa suggested, brief examination of sensitivity of estimated trends to the selected analysis period (e.g., use of 1979 to 1999; use of 1979 to 2001 or 2003 [for the small number of model 20c3m runs ending after 1999]; use of data for the post-NOAA9 period).

This will be a fair bit of effort, but I think it's worth it. Douglass et al. will try to make maximum political hay out of their IJC paper - which has already been sent to Andy Revkin at the New York Times. You can bet they've sent it elsewhere, too. I'm pretty sure that our colleague JC will portray Douglass et al. as definitive "proof" that all

climate models are fundamentally flawed, UAH data are in amazing agreement with sonde-based estimates of tropospheric temperature change, global warming is not a serious problem, etc.

One of the most disturbing aspects of Douglass et al. is its abrupt dismissal of the finding (by Sherwood et al. and Randel and Wu) of a residual tropospheric cooling bias in the sonde data. Douglass et al. base this dismissal on the Christy et al. (2007) JGR paper, and on Christy's finding of biases in the night-time sonde data that magically offset the biases in the day-time data. Does that sound familiar? When did we last hear about new biases magically offsetting the effect of recently-discovered biases? As Yogi Berra would say, this is *deja vu* all over again....

I hope that one of the papers on the new sonde-based datasets directly addresses the subject of 'error compensation' in the day-time and night-time sonde data. This would be important to do.

It's unfortunate that Douglass et al. will probably be published well before the appearance of the papers on the new radiosonde datasets, and before an updated comparison of modeled-and observed tropospheric temperature trends.

I'd be grateful if you could let me know whether you are in agreement with the response strategy I've outlined above, and would like to be involved with an update of our 2005 Science paper.

With best regards,

Ben

<x-flowed>
Dear Phil,

Just a quick response to the issue of "model weighting" which you and Carl raised in your emails.

We recently published a paper dealing with the identification of an anthropogenic fingerprint in SSM/I-based estimates of total column water vapor changes. This was a true multi-model detection and attribution ("D&A") study, which made use of results from 22 different A/OGCMs for fingerprint and noise estimation. Together with Peter Gleckler and Karl Taylor, I'm now in the process of repeating our water vapor D&A study using a subset of the original 22 models. This subset will comprise 10-12 models which are demonstrably more successful in capturing features of the observed mean state and variability of water vapor and SST - particularly features crucial to the D&A problem (such as the low-frequency variability). We've had fun computing a whole range of metrics that might be used to define such a subset of "better" models. The ultimate goal is to determine the sensitivity of our water vapor D&A results to model quality. I think that this kind of analysis will be unavoidable in the multi-model world in which we now live. Given substantial inter-model differences in simulation quality, "one model, one vote" is probably not the best policy for D&A work!

Once we've used Carl's method to calculate synthetic MSU temperatures from the IPCC AR4 20c3m data (as described in my previous email), it should be relatively easy to do a similar "model culling" exercise with MSU T2, T4, and TLT. In fact, this is what we had already planned to do in collaboration with Carl and Frank.

One key point in any model weighting or selection strategy is to avoid circularity. In the D&A context, it would be impermissible to include information on trend behavior as a criterion used for selecting "better" models. Likewise, if our interest is in assessing the statistical significance of model-versus-observed trend differences, we can't use model performance in simulating "observed" tropospheric or stratospheric trends (whatever those might be!) as a means of identifying more credible models.

A further issue, of course, is that we are relying on results from fully coupled A/OGCMs, and are making trend comparisons over relatively short periods (several decades). On these short timescales, estimates of the "true" trend in response to the applied 20c3m forcings are quite sensitive to natural variability noise (as Peter Thorne's 2007 GRL paper clearly illustrates). Because of such chaotic variability, even a hypothetical model with perfect physics and forcings would yield a distribution of tropospheric temperature trends over 1979 to 1999, some of which would show larger or smaller cooling than observed. This is why it's illogical to stratify model results according to correspondence between modeled and observed surface warming - something which John Christy is very fond of doing.

What we've done (in the new water vapor work described above) is to evaluate the fidelity with which the AR4 models simulate the observed mean state and variability of precipitable water and SST - not the trends in these quantities. We've looked at a model performance in a variety of different regions, and on multiple timescales. The results are fascinating, and show (at least for water vapor and SST) that every model has its own individual strengths and weaknesses. It is difficult to identify a subset of models that CONSISTENTLY does well in many different regions and over a range of different timescales.

My guess is that we would obtain somewhat different results for MSU temperatures - particularly for comparisons involving variability. Clearly, the absence of volcanic forcing in roughly half of the 20c3m experiments will have a large impact on the estimated variability of synthetic T4 temperatures (and perhaps even on T2), and hence on model-versus-data variability comparisons. It's also quite possible that the inclusion or absence of volcanic forcing has an impact not only on the amplitude of the variability of global-mean T4 anomalies, but also on the pattern of T4 variability. So model ranking exercises based on performance in simulating the mean state and variability of T4 and T2 may show some connection to the presence or absence of volcanic/ozone forcing.

The sad thing is we are being distracted from doing this fun stuff by the need to respond to Douglass et al. That's a real shame.

With best regards,

Ben

Dear Melissa,

No, this would not be dire. What is dire is Douglass et al.'s willful neglect of any observational datasets that do not support their arguments. Recall that our 2005 Science paper presented information from all observational datasets available to us at that time, even from datasets that showed large differences relative to the model data. We did not present results from RSS alone.

With best regards,

Ben

Hello Ben and Colleagues,

I've been following these exchanges with interest. One particular point in your message below is a little puzzling to me. That's the issue of trying to avoid circularity in the culling of models for any given D&A study.

Two potential problems occur to me. One is that choosing models on the basis of their fidelity to observed regional and short term variability may not be completely orthogonal to choosing based on long-term trend. That's because those smaller scale changes may contribute to the trends and their patterns. Second, choosing a different set of models for one variable (temperature) than for another (humidity) seems highly problematic. If we are interested in projections of other variables, e.g. storm tracks or cloud cover, for which D&A has not been done, which group of models would we then deem to be most credible? I don't have a good alternative to propose, but, in light of these considerations, maybe one-model-one-vote doesn't appear so unreasonable after all.

With regards,
Dian

Dear all,

I think the scientific fraud committed by Douglass needs to be exposed. His co-authors may be innocent bystanders, but I doubt it.

In normal circumstances, what Douglass has done would cause him to lose his job -- a parallel is the South Korean cloning fraud case.

I have suggested that someone like Chris Mooney should be told about this.

Tom.

Dear Tim,

Thanks for the "heads up". As Phil mentioned, I was already aware of this. The Douglass et al. paper was rejected twice before it was finally accepted by IJC. I think this paper is a real embarrassment for the IJC. It has serious scientific flaws. I'm already working on a response.

Phil can tell you about some of the other sordid details of Douglass et al. These guys ignored information from radiosonde datasets that did not support their "models are wrong" argument (even though they had these datasets in their possession). Pretty deplorable behaviour...

Douglass is the guy who famously concluded (after examining the temperature response to Pinatubo) that the climate system has negative sensitivity. Amazingly, he managed to publish that crap in GRL. Christy sure does manage to pick some brilliant scientific collaborators...

With best regards,

Ben

<x-flowed>
Dear folks,

I've been doing some calculations to address one of the statistical issues raised by the Douglass et al. paper in the International Journal of Climatology. Here are some of my results.

Recall that Douglass et al. calculated synthetic T2LT and T2 temperatures from the CMIP-3 archive of 20th century simulations ("20c3m" runs). They used a total of 67 20c3m realizations, performed with 22 different models. In calculating the statistical uncertainty of the model trends, they introduced $\sigma\{SE\}$, an "estimate of the uncertainty of the mean of the predictions of the trends". They defined $\sigma\{SE\}$ as follows:

$\sigma\{SE\} = \sigma / \sqrt{N - 1}$, where

"N = 22 is the number of independent models".

As we've discussed in our previous correspondence, this definition has serious problems (see comments from Carl and Steve below), and allows Douglass et al. to reach the erroneous conclusion that modeled T2LT and T2 trends are significantly different from the observed T2LT and T2 trends in both the RSS and UAH datasets. This comparison of simulated and observed T2LT and T2 trends is given in Table III of Douglass et al. [As an amusing aside, I note that the RSS datasets are referred to as "RSS" in this table, while UAH results are designated as "MSU". I guess there's only one true "MSU" dataset...]

I decided to take a quick look at the issue of the statistical significance of differences between simulated and observed tropospheric temperature trends. My first cut at this "quick look" involves only UAH and RSS observational data - I have not yet done any tests with radiosonde data, UMD T2 data, or satellite results from Zou et al.

I operated on the same 49 realizations of the 20c3m experiment that we

used in Chapter 5 of CCSP 1.1. As in our previous work, all model results are synthetic T2LT and T2 temperatures that I calculated using a static weighting function approach. I have not yet implemented Carl's more sophisticated method of estimating synthetic MSU temperatures from model data (which accounts for effects of topography and land/ocean differences). However, for the current application, the simple static weighting function approach is more than adequate, since we are focusing on T2LT and T2 changes over tropical oceans only - so topographic and land-ocean differences are unimportant. Note that I still need to calculate synthetic MSU temperatures from about 18-20 20c3m realizations which were not in the CMIP-3 database at the time we were working on the CCSP report. For the full response to Douglass et al., we should use the same 67 20c3m realizations that they employed.

For each of the 49 realizations that I processed, I first masked out all tropical land areas, and then calculated the spatial averages of monthly-mean, gridded T2LT and T2 data over tropical oceans (20N-20S). All model and observational results are for the common 252-month period from January 1979 to December 1999 - the longest period of overlap between the RSS and UAH MSU data and the bulk of the 20c3m runs. The simulated trends given by Douglass et al. are calculated over the same 1979 to 1999 period; however, they use a longer period (1979 to 2004) for calculating observational trends - so there is an inconsistency between their model and observational analysis periods, which they do not explain. This difference in analysis periods is a little puzzling given that we are dealing with relatively short observational record lengths, resulting in some sensitivity to end-point effects.

I then calculated anomalies of the spatially-averaged T2LT and T2 data (w.r.t. climatological monthly-means over 1979-1999), and fit least-squares linear trends to model and observational time series. The standard errors of the trends were adjusted for temporal autocorrelation of the regression residuals, as described in Santer et al. (2000) ["Statistical significance of trends and trend differences in layer-average atmospheric temperature time series"; JGR 105, 7337-7356.]

Consider first panel A of the attached plot. This shows the simulated and observed T2LT trends over 1979 to 1999 (again, over 20N-20S, oceans only) with their adjusted 1-sigma confidence intervals). For the UAH and RSS data, it was possible to check against the adjusted confidence intervals independently calculated by Dian during the course of work on the CCSP report. Our adjusted confidence intervals are in good agreement. The grey shaded envelope in panel A denotes the 1-sigma standard error for the RSS T2LT trend.

There are 49 pairs of UAH-minus-model trend differences and 49 pairs of RSS-minus-model trend differences. We can therefore test - for each model and each 20c3m realization - whether there is a statistically significant difference between the observed and simulated trends.

Let b_x and b_y represent any single pair of modeled and observed trends, with adjusted standard errors $s\{b_x\}$ and $s\{b_y\}$. As in our previous work (and as in related work by John Lanzante), we define the normalized trend difference d as:

$$d = (bx - by) / \text{sqrt}[(s\{bx\})^{**2} + (s\{by\})^{**2}]$$

Under the assumption that d is normally distributed, values of $d > +1.96$ or $d < -1.96$ indicate observed-minus-model trend differences that are significant at the 5% level. We are performing a two-tailed test here, since we have no information a priori about the "direction" of the model trend (i.e., whether we expect the simulated trend to be significantly larger or smaller than observed).

Panel c shows values of the normalized trend difference for T2LT trends. The grey shaded area spans the range $+1.96$ to -1.96 , and identifies the region where we fail to reject the null hypothesis (H_0) of no significant difference between observed and simulated trends.

Consider the solid symbols first, which give results for tests involving RSS data. We would reject H_0 in only one out of 49 cases (for the CCCma-CGCM3.1(T47) model). The open symbols indicate results for tests involving UAH data. Somewhat surprisingly, we get the same qualitative outcome that we obtained for tests involving RSS data: only one of the UAH-model trend pairs yields a difference that is statistically significant at the 5% level.

Panels b and d provide results for T2 trends. Results are very similar to those achieved with T2LT trends. Irrespective of whether RSS or UAH T2 data are used, significant trend differences occur in only one of 49 cases.

Bottom line: Douglass et al. claim that "In all cases UAH and RSS satellite trends are inconsistent with model trends." (page 6, lines 61-62). This claim is categorically wrong. In fact, based on our results, one could justifiably claim that THERE IS ONLY ONE CASE in which model T2LT and T2 trends are inconsistent with UAH and RSS results! These guys screwed up big time.

SENSITIVITY TESTS

QUESTION 1: Some of the model-data trend comparisons made by Douglass et al. used temperatures averaged over 30N-30S rather than 20N-20S. What happens if we repeat our simple trend significance analysis using T2LT and T2 data averaged over ocean areas between 30N-30S?

ANSWER 1: Very little. The results described above for oceans areas between 20N-20S are virtually unchanged.

QUESTION 2: Even though it's clearly inappropriate to estimate the standard errors of the linear trends WITHOUT accounting for temporal autocorrelation effects (the 252 time sample are clearly not independent; effective sample sizes typically range from 6 to 56), someone is bound to ask what the outcome is when one repeats the paired trend tests with non-adjusted standard errors. So here are the results:

T2LT tests, RSS observational data: 19 out of 49 trend differences are significant at the 5% level.

T2LT tests, UAH observational data: 34 out of 49 trend differences are significant at the 5% level.

T2 tests, RSS observational data: 16 out of 49 trend differences are significant at the 5% level.

T2 tests, UAH observational data: 35 out of 49 trend differences are significant at the 5% level.

So even under the naive (and incorrect) assumption that each model and observational time series contains 252 independent time samples, we STILL find no support for Douglass et al.'s assertion that: "In all cases UAH and RSS satellite trends are inconsistent with model trends." Q.E.D.

If Leo is agreeable, I'm hopeful that we'll be able to perform a similar trend comparison using synthetic MSU T2LT and T2 temperatures calculated from the RAOBCORE radiosonde data - all versions, not just v1.2!

As you can see from the email list, I've expanded our "focus group" a little bit, since a number of you have written to me about this issue.

I am leaving for Miami on Monday, Dec. 17th. My Mom is having cataract surgery, and I'd like to be around to provide her with moral and practical support. I'm not exactly sure when I'll be returning to PCMDI - although I hope I won't be gone longer than a week. As soon as I get back, I'll try to make some more progress with this stuff. Any suggestions or comments on what I've done so far would be greatly appreciated. And for the time being, I think we should not alert Douglass et al. to our results.

With best regards, and happy holidays! May all your "Singers" be carol singers, and not of the S. Fred variety...

Ben

(P.S.: I noticed one unfortunate typo in Table II of Douglass et al. The MIROC3.2 (medres) model is referred to as "MIROC3.2_Merdes"....)

<x-flowed>
Dear folks,

I've been doing some calculations to address one of the statistical issues raised by the Douglass et al. paper in the International Journal of Climatology. Here are some of my results.

Recall that Douglass et al. calculated synthetic T2LT and T2 temperatures from the CMIP-3 archive of 20th century simulations ("20c3m" runs). They used a total of 67 20c3m realizations, performed with 22 different models. In calculating the statistical uncertainty of the model trends, they introduced $\sigma\{SE\}$, an "estimate of the uncertainty of the mean of the predictions of the trends". They defined $\sigma\{SE\}$ as follows:

$\sigma\{SE\} = \sigma / \sqrt{N - 1}$, where

"N = 22 is the number of independent models".

As we've discussed in our previous correspondence, this definition has serious problems (see comments from Carl and Steve below), and allows Douglass et al. to reach the erroneous conclusion that modeled T2LT and T2 trends are significantly different from the observed T2LT and T2 trends in both the RSS and UAH datasets. This comparison of simulated and observed T2LT and T2 trends is given in Table III of Douglass et al. [As an amusing aside, I note that the RSS datasets are referred to as "RSS" in this table, while UAH results are designated as "MSU". I guess there's only one true "MSU" dataset...]

I decided to take a quick look at the issue of the statistical significance of differences between simulated and observed tropospheric temperature trends. My first cut at this "quick look" involves only UAH and RSS observational data - I have not yet done any tests with radiosonde data, UMD T2 data, or satellite results from Zou et al.

I operated on the same 49 realizations of the 20c3m experiment that we

used in Chapter 5 of CCSP 1.1. As in our previous work, all model results are synthetic T2LT and T2 temperatures that I calculated using a static weighting function approach. I have not yet implemented Carl's more sophisticated method of estimating synthetic MSU temperatures from model data (which accounts for effects of topography and land/ocean differences). However, for the current application, the simple static weighting function approach is more than adequate, since we are focusing on T2LT and T2 changes over tropical oceans only - so topographic and land-ocean differences are unimportant. Note that I still need to calculate synthetic MSU temperatures from about 18-20 20c3m realizations which were not in the CMIP-3 database at the time we were working on the CCSP report. For the full response to Douglass et al., we should use the same 67 20c3m realizations that they employed.

For each of the 49 realizations that I processed, I first masked out all tropical land areas, and then calculated the spatial averages of monthly-mean, gridded T2LT and T2 data over tropical oceans (20N-20S). All model and observational results are for the common 252-month period from January 1979 to December 1999 - the longest period of overlap between the RSS and UAH MSU data and the bulk of the 20c3m runs. The simulated trends given by Douglass et al. are calculated over the same 1979 to 1999 period; however, they use a longer period (1979 to 2004) for calculating observational trends - so there is an inconsistency between their model and observational analysis periods, which they do not explain. This difference in analysis periods is a little puzzling given that we are dealing with relatively short observational record lengths, resulting in some sensitivity to end-point effects.

I then calculated anomalies of the spatially-averaged T2LT and T2 data (w.r.t. climatological monthly-means over 1979-1999), and fit least-squares linear trends to model and observational time series. The standard errors of the trends were adjusted for temporal autocorrelation of the regression residuals, as described in Santer et al. (2000) ["Statistical significance of trends and trend differences in layer-average atmospheric temperature time series"; JGR 105, 7337-7356.]

Consider first panel A of the attached plot. This shows the simulated and observed T2LT trends over 1979 to 1999 (again, over 20N-20S, oceans only) with their adjusted 1-sigma confidence intervals). For the UAH and RSS data, it was possible to check against the adjusted confidence intervals independently calculated by Dian during the course of work on the CCSP report. Our adjusted confidence intervals are in good agreement. The grey shaded envelope in panel A denotes the 1-sigma standard error for the RSS T2LT trend.

There are 49 pairs of UAH-minus-model trend differences and 49 pairs of RSS-minus-model trend differences. We can therefore test - for each model and each 20c3m realization - whether there is a statistically significant difference between the observed and simulated trends.

Let b_x and b_y represent any single pair of modeled and observed trends, with adjusted standard errors $s\{b_x\}$ and $s\{b_y\}$. As in our previous work (and as in related work by John Lanzante), we define the normalized trend difference d as:

$$d = (bx - by) / \text{sqrt}[(s\{bx\})^{**2} + (s\{by\})^{**2}]$$

Under the assumption that d is normally distributed, values of $d > +1.96$ or $d < -1.96$ indicate observed-minus-model trend differences that are significant at the 5% level. We are performing a two-tailed test here, since we have no information a priori about the "direction" of the model trend (i.e., whether we expect the simulated trend to be significantly larger or smaller than observed).

Panel c shows values of the normalized trend difference for T2LT trends. The grey shaded area spans the range $+1.96$ to -1.96 , and identifies the region where we fail to reject the null hypothesis (H_0) of no significant difference between observed and simulated trends.

Consider the solid symbols first, which give results for tests involving RSS data. We would reject H_0 in only one out of 49 cases (for the CCCma-CGCM3.1(T47) model). The open symbols indicate results for tests involving UAH data. Somewhat surprisingly, we get the same qualitative outcome that we obtained for tests involving RSS data: only one of the UAH-model trend pairs yields a difference that is statistically significant at the 5% level.

Panels b and d provide results for T2 trends. Results are very similar to those achieved with T2LT trends. Irrespective of whether RSS or UAH T2 data are used, significant trend differences occur in only one of 49 cases.

Bottom line: Douglass et al. claim that "In all cases UAH and RSS satellite trends are inconsistent with model trends." (page 6, lines 61-62). This claim is categorically wrong. In fact, based on our results, one could justifiably claim that THERE IS ONLY ONE CASE in which model T2LT and T2 trends are inconsistent with UAH and RSS results! These guys screwed up big time.

SENSITIVITY TESTS

QUESTION 1: Some of the model-data trend comparisons made by Douglass et al. used temperatures averaged over 30N-30S rather than 20N-20S. What happens if we repeat our simple trend significance analysis using T2LT and T2 data averaged over ocean areas between 30N-30S?

ANSWER 1: Very little. The results described above for oceans areas between 20N-20S are virtually unchanged.

QUESTION 2: Even though it's clearly inappropriate to estimate the standard errors of the linear trends WITHOUT accounting for temporal autocorrelation effects (the 252 time sample are clearly not independent; effective sample sizes typically range from 6 to 56), someone is bound to ask what the outcome is when one repeats the paired trend tests with non-adjusted standard errors. So here are the results:

T2LT tests, RSS observational data: 19 out of 49 trend differences are significant at the 5% level.

T2LT tests, UAH observational data: 34 out of 49 trend differences are significant at the 5% level.

T2 tests, RSS observational data: 16 out of 49 trend differences are significant at the 5% level.

T2 tests, UAH observational data: 35 out of 49 trend differences are significant at the 5% level.

So even under the naive (and incorrect) assumption that each model and observational time series contains 252 independent time samples, we STILL find no support for Douglass et al.'s assertion that: "In all cases UAH and RSS satellite trends are inconsistent with model trends." Q.E.D.

If Leo is agreeable, I'm hopeful that we'll be able to perform a similar trend comparison using synthetic MSU T2LT and T2 temperatures calculated from the RAOBCORE radiosonde data - all versions, not just v1.2!

As you can see from the email list, I've expanded our "focus group" a little bit, since a number of you have written to me about this issue.

<x-flowed>

Dear Tom,

As promised, I've now repeated all of the significance testing involving model-versus-observed trend differences, but this time using spatially-averaged T2 and T2LT changes that are not "masked out" over tropical land areas. As I mentioned this morning, the use of non-masked data facilitates a direct comparison with Douglass et al.

The results for combined changes over tropical land and ocean are very similar to those I sent out yesterday, which were for T2 and T2LT changes over tropical oceans only:

COMBINED LAND/OCEAN RESULTS (WITH STANDARD ERRORS ADJUSTED FOR TEMPORAL AUTOCORRELATION EFFECTS; SPATIAL AVERAGES OVER 20N-20S; ANALYSIS PERIOD 1979 TO 1999)

T2LT tests, RSS observational data: 0 out of 49 model-versus-observed trend differences are significant at the 5% level.

T2LT tests, UAH observational data: 1 out of 49 model-versus-observed trend differences are significant at the 5% level.

T2 tests, RSS observational data: 1 out of 49 model-versus-observed trend differences are significant at the 5% level.

T2 tests, UAH observational data: 1 out of 49 model-versus-observed trend differences are significant at the 5% level.

So our conclusion - that model tropical T2 and T2LT trends are, in virtually all realizations and models, not significantly different from either RSS or UAH trends - is not sensitive to whether we do the significance testing with "ocean only" or combined "land+ocean" temperature changes.

With best regards, and happy holidays to all!

Ben

Thanks Ben,

You have the makings of a nice article.

I note that we would expect to 10 cases that are significantly different by chance (based

on the 196 tests at the .05 sig level). You found 3. With appropriately corrected Leopold

I suspect you will find there is indeed stat sig. similar trends incl. amplification.

Setting up the statistical testing should be interesting with this many combinations.

Regards, Tom

Ben Santer said the following on 12/14/2007 5:31 PM:

Dear Tom,

As promised, I've now repeated all of the significance testing involving

model-versus-observed trend differences, but this time using spatially-averaged T2 and

T2LT changes that are not "masked out" over tropical land areas. As I mentioned this

morning, the use of non-masked data facilitates a direct comparison with Douglass et al.

The results for combined changes over tropical land and ocean are very similar to those

I sent out yesterday, which were for T2 and T2LT changes over tropical oceans only:

COMBINED LAND/OCEAN RESULTS (WITH STANDARD ERRORS ADJUSTED FOR TEMPORAL AUTOCORRELATION

EFFECTS; SPATIAL AVERAGES OVER 20N-20S; ANALYSIS PERIOD 1979 TO 1999)

T2LT tests, RSS observational data: 0 out of 49 model-versus-observed trend differences

are significant at the 5% level.

T2LT tests, UAH observational data: 1 out of 49 model-versus-observed trend differences

are significant at the 5% level.

T2 tests, RSS observational data: 1 out of 49 model-versus-observed trend differences

are significant at the 5% level.

T2 tests, UAH observational data: 1 out of 49 model-versus-observed trend differences

are significant at the 5% level.

So our conclusion - that model tropical T2 and T2LT trends are, in virtually all

realizations and models, not significantly different from either RSS or UAH trends - is

not sensitive to whether we do the significance testing with "ocean only" or combined

"land+ocean" temperature changes.

With best regards, and happy holidays to all!

Ben

Thomas.R.Karl wrote:

Ben,

This is very informative. One question I raise is whether the results would have been

at all different if you had not masked the land. I doubt it, but it would be nice to

know.

Tom

Ben Santer said the following on 12/13/2007 9:58 PM:

Dear folks,

I've been doing some calculations to address one of the statistical issues raised by the

Douglass et al. paper in the International Journal of Climatology.

Here are some of my

results.

Recall that Douglass et al. calculated synthetic T2LT and T2 temperatures from the

CMIP-3 archive of 20th century simulations ("20c3m" runs). They used a total of 67 20c3m

realizations, performed with 22 different models. In calculating the statistical

uncertainty of the model trends, they introduced $\sigma\{SE\}$, an "estimate of the

uncertainty of the mean of the predictions of the trends". They defined

$\sigma\{SE\}$ as follows:

$\sigma\{SE\} = \sigma / \sqrt{N - 1}$, where

"N = 22 is the number of independent models".

As we've discussed in our previous correspondence, this definition has serious problems

(see comments from Carl and Steve below), and allows Douglass et al. to reach the

erroneous conclusion that modeled T2LT and T2 trends are significantly different from

the observed T2LT and T2 trends in both the RSS and UAH datasets.

This comparison of

simulated and observed T2LT and T2 trends is given in Table III of Douglass et al.

[As an amusing aside, I note that the RSS datasets are referred to as "RSS" in this table, while UAH results are designated as "MSU". I guess there's only one true "MSU" dataset...]

I decided to take a quick look at the issue of the statistical significance of differences between simulated and observed tropospheric temperature trends. My first cut at this "quick look" involves only UAH and RSS observational data - I have not yet done any tests with radiosonde data, UMD T2 data, or satellite results from Zou et al.

I operated on the same 49 realizations of the 20c3m experiment that we used in Chapter 5

of CCSP 1.1. As in our previous work, all model results are synthetic T2LT and T2 temperatures that I calculated using a static weighting function approach. I have not yet implemented Carl's more sophisticated method of estimating synthetic MSU

temperatures from model data (which accounts for effects of topography and land/ocean differences). However, for the current application, the simple static weighting function approach is more than adequate, since we are focusing on T2LT and T2 changes over

tropical oceans only - so topographic and land-ocean differences are unimportant. Note

that I still need to calculate synthetic MSU temperatures from about 18-20 20c3m

realizations which were not in the CMIP-3 database at the time we were working on the

CCSP report. For the full response to Douglass et al., we should use the same 67 20c3m

realizations that they employed.

For each of the 49 realizations that I processed, I first masked out all tropical land

areas, and then calculated the spatial averages of monthly-mean, gridded T2LT and T2

data over tropical oceans (20N-20S). All model and observational results are for the

common 252-month period from January 1979 to December 1999 - the longest period of

overlap between the RSS and UAH MSU data and the bulk of the 20c3m runs. The simulated

trends given by Douglass et al. are calculated over the same 1979 to 1999 period;

however, they use a longer period (1979 to 2004) for calculating observational trends -

so there is an inconsistency between their model and observational analysis periods,

which they do not explain. This difference in analysis periods is a little puzzling

given that we are dealing with relatively short observational record lengths, resulting

in some sensitivity to end-point effects.

I then calculated anomalies of the spatially-averaged T2LT and T2 data (w.r.t.

climatological monthly-means over 1979-1999), and fit least-squares linear trends to

model and observational time series. The standard errors of the trends were adjusted for

temporal autocorrelation of the regression residuals, as described in Santer et al.

(2000) ["Statistical significance of trends and trend differences in layer-average

atmospheric temperature time series"; JGR 105, 7337-7356.]

Consider first panel A of the attached plot. This shows the simulated and observed T2LT

trends over 1979 to 1999 (again, over 20N-20S, oceans only) with their adjusted 1-sigma

confidence intervals). For the UAH and RSS data, it was possible to check against the

adjusted confidence intervals independently calculated by Dian during the course of work

on the CCSP report. Our adjusted confidence intervals are in good agreement. The grey

shaded envelope in panel A denotes the 1-sigma standard error for the RSS T2LT trend.

There are 49 pairs of UAH-minus-model trend differences and 49 pairs of RSS-minus-model

trend differences. We can therefore test - for each model and each 20c3m realization -

whether there is a statistically significant difference between the observed and

simulated trends.

Let b_x and b_y represent any single pair of modeled and observed trends, with adjusted

standard errors $s\{b_x\}$ and $s\{b_y\}$. As in our previous work (and as in related work by John

Lanzante), we define the normalized trend difference d as:

$$d = (b_x - b_y) / \sqrt{(s\{b_x\})^2 + (s\{b_y\})^2}$$

Under the assumption that d is normally distributed, values of $d > +1.96$ or < -1.96

indicate observed-minus-model trend differences that are significant at the 5% level. We

are performing a two-tailed test here, since we have no information a priori about the

"direction" of the model trend (i.e., whether we expect the simulated trend to be

significantly larger or smaller than observed).

Panel c shows values of the normalized trend difference for T2LT trends.

the grey shaded area spans the range +1.96 to -1.96, and identifies the region where we

fail to reject the null hypothesis (H0) of no significant difference between observed and simulated trends.

Consider the solid symbols first, which give results for tests involving RSS data. We

would reject H0 in only one out of 49 cases (for the CCCma-CGCM3.1(T47) model). The open

symbols indicate results for tests involving UAH data. Somewhat surprisingly, we get the

same qualitative outcome that we obtained for tests involving RSS data: only one of the

UAH-model trend pairs yields a difference that is statistically significant at the 5%

level.

Panels b and d provide results for T2 trends. Results are very similar to those achieved

with T2LT trends. Irrespective of whether RSS or UAH T2 data are used, significant trend

differences occur in only one of 49 cases.

Bottom line: Douglass et al. claim that "In all cases UAH and RSS satellite trends are

inconsistent with model trends." (page 6, lines 61-62). This claim is categorically

wrong. In fact, based on our results, one could justifiably claim that THERE IS ONLY ONE

CASE in which model T2LT and T2 trends are inconsistent with UAH and RSS results! These

guys screwed up big time.

SENSITIVITY TESTS

QUESTION 1: Some of the model-data trend comparisons made by Douglass et al. used

temperatures averaged over 30N-30S rather than 20N-20S. What happens if we repeat our

simple trend significance analysis using T2LT and T2 data averaged over ocean areas

between 30N-30S?

ANSWER 1: Very little. The results described above for oceans areas between 20N-20S are

virtually unchanged.

QUESTION 2: Even though it's clearly inappropriate to estimate the standard errors of

the linear trends WITHOUT accounting for temporal autocorrelation effects (the 252 time

sample are clearly not independent; effective sample sizes typically range from 6 to

56), someone is bound to ask what the outcome is when one repeats the paired trend tests

with non-adjusted standard errors. So here are the results:

T2LT tests, RSS observational data: 19 out of 49 trend differences are significant at

the 5% level.

T2LT tests, UAH observational data: 34 out of 49 trend differences are significant at

the 5% level.

T2 tests, RSS observational data: 16 out of 49 trend differences are significant at the 5% level.

T2 tests, UAH observational data: 35 out of 49 trend differences are significant at the 5% level.

So even under the naive (and incorrect) assumption that each model and observational

time series contains 252 independent time samples, we STILL find no support for Douglass

et al.'s assertion that: "In all cases UAH and RSS satellite trends are inconsistent with model trends."

Q.E.D.

If Leo is agreeable, I'm hopeful that we'll be able to perform a similar trend

comparison using synthetic MSU T2LT and T2 temperatures calculated from the RAOBCORE

radiosonde data - all versions, not just v1.2!

As you can see from the email list, I've expanded our "focus group" a little bit, since

a number of you have written to me about this issue.

I am leaving for Miami on Monday, Dec. 17th. My Mom is having cataract surgery, and I'd

like to be around to provide her with moral and practical support. I'm not exactly sure

when I'll be returning to PCMDI - although I hope I won't be gone longer than a week. As

soon as I get back, I'll try to make some more progress with this stuff. Any suggestions

or comments on what I've done so far would be greatly appreciated. And for the time

being, I think we should not alert Douglass et al. to our results.

With best regards, and happy holidays! May all your "Singers" be carol singers, and not

of the S. Fred variety...

Ben

(P.S.: I noticed one unfortunate typo in Table II of Douglass et al. The MIROC3.2

(medres) model is referred to as "MIROC3.2_Merdes"....)

carl mears wrote:

Hi Steve

I'd say it's the equivalent of rolling a 6-sided die a hundred times, and

finding a mean value of ~3.5 and a standard deviation of ~1.7, and calculating the standard error of the mean to be ~0.17 (so far so good). An then rolling the die one more time, getting a 2, and claiming that the die is no longer 6 sided because the new measurement

is more than 2 standard errors from the mean.

In my view, this problem trumps the other problems in the paper.

I can't believe Douglas is a fellow of the American Physical Society.

<x-flowed>
Dear all,

I have attached a plot which summarizes the recent developments concerning tropical radiosonde temperature datasets and which could be a candidate to be included in a reply to Douglass et al. It contains trend profiles from unadjusted radiosondes, HadAT2-adjusted radiosondes, RAOBCORE (versions 1.2-1.4) adjusted radiosondes and from radiosondes adjusted with a neighbor composite method (RICH) that uses the break dates detected with RAOBCORE (v1.4) as metadata. RAOBCORE v1.2,v1.3 are documented in Haimberger (2007), RAOBCORE v1.4 and RICH are discussed in the manuscript I mentioned in my previous email.

Latitude range is 20S-20N, only time series with less than 24 months of missing data are included. Spatial sampling of all curves is the same except HadAT which contains less stations that meet the 24month criterion. Sampling uncertainty of the trend curves is ca. $\pm 0.1\text{K/decade}$ (95% percentiles estimated with bootstrap method).

RAOBCORE v1.3,1.4 and RICH are results from ongoing research and warming trends from radiosondes may still be underestimated. The upper tropospheric warming maxima from RICH are even larger (up to 0.35K/decade , not shown), if only radiosondes within the tropics (20N-20S) are allowed as reference for adjustment of tropical radiosonde temperatures. The pink/blue curves in the attached plot should therefore not be regarded as upper bound of what may be achieved with plausible choices of reference series for homogenization.

Please let me know your comments.

I wish you a merry Christmas.

With best regards

Leo

Subject: More significance testing
Date: Thu, 27 Dec 2007 16:26:19 -0800
Reply-to: santer1@llnl.gov

<x-flowed>

Dear folks,

This email briefly summarizes the trend significance test results. As I mentioned in yesterday's email, I've added a new case (referred to as "TYPE3" below). I've also added results for tests with a stipulated 10% significance level. Here is the explanation of the four different types of trend test:

1. "OBS-vs-MODEL": Observed MSU trends in RSS and UAH are tested against trends in synthetic MSU data in 49 realizations of the 20c3m experiment. Results from RSS and UAH are pooled, yielding a total of 98 tests for T2 trends and 98 tests for T2LT trends.

2. "MODEL-vs-MODEL (TYPE1)": Involves model data only. Trend in synthetic MSU data in each of 49 20c3m realizations is tested against each trend in the remaining 48 realizations (i.e., no trend tests involving identical data). Yields a total of $49 \times 48 = 2352$ tests. The significance of trend differences is a function of BOTH inter-model differences (in climate sensitivity, applied 20c3m forcings, and the amplitude of variability) AND "within-model" effects (i.e., is related to the different manifestations of natural internal variability superimposed on the underlying forced response).

3. "MODEL-vs-MODEL (TYPE2)": Involves model data only. Limited to the M models with multiple realizations of the 20c3m experiment. For each of these M models, the number of unique combinations C of N 20c3m realizations into R trend pairs is determined. For example, in the case of $N = 5$, $C = N! / [R!(N-R)!] = 10$. The significance of trend differences is solely a function of "within-model" effects (i.e., is related to the different manifestations of natural internal variability superimposed on the underlying forced response). There are a total of 62 tests (not 124, as I erroneously reported yesterday!)

4. "MODEL-vs-MODEL (TYPE3)": Involves model data only. For each of the 19 models, only the first 20c3m realization is used. The trend in each model's first 20c3m realization is tested against each trend in the

first 20c3m realization of the remaining 18 models. Yields a total of 19 x 18 = 342 tests. The significance of trend differences is solely a function of inter-model differences (in climate sensitivity, applied 20c3m forcings, and the amplitude of variability).

REJECTION RATES FOR STIPULATED 5% SIGNIFICANCE LEVEL

| Test type | No. of tests | T2 "Hits" | T2LT "Hits" |
|---------------------------|----------------|------------|-------------|
| 1. OBS-vs-MODEL | 49 x 2 (98) | 2 (2.04%) | 1 (1.02%) |
| 2. MODEL-vs-MODEL (TYPE1) | 49 x 48 (2352) | 58 (2.47%) | 32 (1.36%) |
| 3. MODEL-vs-MODEL (TYPE2) | --- (62) | 0 (0.00%) | 0 (0.00%) |
| 4. MODEL-vs-MODEL (TYPE3) | 19 x 18 (342) | 22 (6.43%) | 14 (4.09%) |

REJECTION RATES FOR STIPULATED 10% SIGNIFICANCE LEVEL

| Test type | No. of tests | T2 "Hits" | T2LT "Hits" |
|---------------------------|----------------|------------|-------------|
| 1. OBS-vs-MODEL | 49 x 2 (98) | 4 (4.08%) | 2 (2.04%) |
| 2. MODEL-vs-MODEL (TYPE1) | 49 x 48 (2352) | 80 (3.40%) | 46 (1.96%) |
| 3. MODEL-vs-MODEL (TYPE2) | --- (62) | 1 (1.61%) | 0 (0.00%) |
| 4. MODEL-vs-MODEL (TYPE3) | 19 x 18 (342) | 28 (8.19%) | 20 (5.85%) |

REJECTION RATES FOR STIPULATED 20% SIGNIFICANCE LEVEL

| Test type | No. of tests | T2 "Hits" | T2LT "Hits" |
|---------------------------|----------------|-------------|-------------|
| 1. OBS-vs-MODEL | 49 x 2 (98) | 7 (7.14%) | 5 (5.10%) |
| 2. MODEL-vs-MODEL (TYPE1) | 49 x 48 (2352) | 176 (7.48%) | 100 (4.25%) |
| 3. MODEL-vs-MODEL (TYPE2) | --- (62) | 4 (6.45%) | 3 (4.84%) |
| 4. MODEL-vs-MODEL (TYPE3) | 19 x 18 (342) | 42 (12.28%) | 28 (8.19%) |

Features of interest:

A) As you might expect, for each of the three significance levels, TYPE3 tests yield the highest rejection rates of the null hypothesis of "No significant difference in trend". TYPE2 tests yield the lowest rejection rates. This is simply telling us that the inter-model differences in trends tend to be larger than the "between-realization" differences in trends in any individual model.

B) Rejection rates for the model-versus-observed trend tests are consistently LOWER than for the model-versus-model (TYPE3) tests. On average, therefore, the tropospheric trend differences between the observational datasets used here (RSS and UAH) and the synthetic MSU temperatures calculated from 19 CMIP-3 models are actually LESS SIGNIFICANT than the inter-model trend differences arising from differences in sensitivity, 20c3m forcings, and levels of variability.

I also thought that it would be fun to use the model data to explore the implications of Douglass et al.'s flawed statistical procedure. Recall that Douglass et al. compare (in their Table III) the observed T2 and T2LT trends in RSS and UAH with the overall means of the multi-model distributions of T2 and T2LT trends. Their standard error, $\sigma\{SE\}$, is meant to represent an "estimate of the uncertainty of the mean" (i.e., the mean trend). $\sigma\{SE\}$ is given as:

$$\sigma\{SE\} = \sigma / \sqrt{N - 1}$$

where σ is the standard deviation of the model trends, and N is "the

number of independent models" (22 in their case). Douglass et al. apparently estimate sigma using ensemble-mean trends for each model (if 20c3m ensembles are available).

So what happens if we apply this procedure using model data only? This is rather easy to do. As above (in the TYPE1, TYPE2, and TYPE3 tests), I simply used the synthetic MSU trends from the 19 CMIP-3 models employed in our CCSP Report and in Santer et al. 2005 (so N = 19). For each model, I calculated the ensemble-mean 20c3m trend over 1979 to 1999 (where multiple 20c3m realizations were available). Let's call these mean trends $b\{j\}$, where j (the index over models) = 1, 2, .. 19. Further, let's regard $b\{1\}$ as the surrogate observations, and then use Douglass et al.'s approach to test whether $b\{1\}$ is significantly different from the overall mean of the remaining 18 members of $b\{j\}$. Then repeat with $b\{2\}$ as surrogate observations, etc. For each layer-averaged temperature series, this yields 19 tests of the significance of differences in mean trends.

To give you a feel for this stuff, I've reproduced below the results for tests involving T2LT trends. The "OBS" column is the ensemble-mean T2LT trend in the surrogate observations. "MODAVE" is the overall mean trend in the 18 remaining members of the distribution, and "SIGMA" is the 1-sigma standard deviation of these trends. "SIGMA{SE}" is $1 \times \text{SIGMA}\{\text{SE}\}$ (note that Douglass et al. give $2 \times \text{SIGMA}\{\text{SE}\}$ in their Table III; multiplying our $\text{SIGMA}\{\text{SE}\}$ results by two gives values similar to theirs). "NORMD" is simply the normalized difference $(\text{OBS} - \text{MODAVE}) / \text{SIGMA}\{\text{SE}\}$, and "P-VALUE" is the p-value for the normalized difference, assuming that this difference is approximately normally distributed.

| MODEL | "OBS" | MODAVE | SIGMA | SIGMA{SE} | NORMD | P-VALUE |

T2LT: No. of p-values .le. 0.05: 12. Rejection rate: 63.16%
T2LT: No. of p-values .le. 0.10: 13. Rejection rate: 68.42%
T2LT: No. of p-values .le. 0.20: 14. Rejection rate: 73.68%

The corresponding rejection rates for the tests involving T2 data are:

T2: No. of p-values .le. 0.05: 12. Rejection rate: 63.16%
T2: No. of p-values .le. 0.10: 13. Rejection rate: 68.42%
T2: No. of p-values .le. 0.20: 15. Rejection rate: 78.95%

Bottom line: If we applied Douglass et al.'s ridiculous test of difference in mean trends to model data only - in fact, to virtually the same model data they used in their paper - one would conclude that nearly two-thirds of the individual models had trends that were significantly different from the multi-model mean trend! To follow Douglass et al.'s flawed logic, this would mean that two-thirds of the models really aren't models after all...

Happy New Year to all of you!

With best regards,

Ben

Ben,

I have attached the tropical mean trend profiles, now for the period 1979-1999.

RAOBCORE versions show much more upper tropospheric heating for this period, RICH shows slightly more heating. Note also stronger cooling of unadjusted radiosondes in stratospheric layers compared to 1999-2004.

Just for information I have included also zonal mean trend plots for the unadjusted radiosondes (tm), RAOBCORE v1.4 (tmcrr) and RICH (rgmra) I do not suggest that these plots should be included but some of you maybe want to know about the spatial coherence of the zonal mean trends. It is interesting to see the lower tropospheric warming minimum in the tropics in all three plots, which I cannot explain. I believe it is spurious but it is remarkably robust against my adjustment efforts.

Meridional resolution is 10 degrees.

As you can imagine, the tropical upper tropospheric heating maximum at 5S and the cooling in the unadjusted radiosondes at 5N are based on very few long records in these belts. 2-3 in 5S, about 5 in 5N.

Best regards and I wish you all a happy new year.

Dear All,

Thanks very much for the helpful discussion on these issues.

I write to make a point that may not be well recognized regarding the character of the temperature trends in the lowermost stratosphere/upper troposphere. I have already discussed this with Ben but want to share with others since I believe it is relevant to this controversy at least at some altitudes. The question I want to raise is not related to the very important dialogue on how to handle the errors and the statistics, but rather how to think about the models.

The attached paper by Forster et al. appeared recently in GRL. It taught me something I didn't realize, namely that ozone losses and accompanying temperature trends at higher altitudes can strongly affect lower altitudes, through the influence of downwelling longwave. There is now much evidence that ozone has decreased significantly in the tropics near 70 mbar. What we show in the attached paper by Forster et al is that ozone depletion near 70 mbar affects temperatures not only at that level, but also down to lower altitudes. I think this is bound to be important to the tropical temperature trends at least in the 100-50 mbar height range, possibly lower down as well, depending upon the degree to which there is a 'substratosphere' that is more radiatively influenced than the rest of the troposphere. Whether it can have an influence as low as 200 mbar - I don't know. But note that having an

influence could mean reducing the warming there, not necessarily flipping it over to a net cooling. This 'long-distance' physics, whereby ozone depletion and associated cooling up high can affect the thermal structure lower down, is not a point I had understood despite many years of studying the problem so I thought it worthwhile to point it out to you here. It has often been said (I probably said it myself five years ago) that ozone losses and associated cooling can't happen or aren't important in this region - but that is wrong.

Further, the fundamental point made in the paper of Thompson and Solomon a few years back remains worth noting, and is, I believe, now resolved in the more recent Forster et al paper: that the broad structure of the temperature trends, with quite large cooling in the lowermost stratosphere in the tropics, comparable to that seen at higher latitudes, is a feature NOT explained by e.g. CO2 cooling, but now can be explained by the observed ozone losses. Exactly how big the tropical cooling is, and exactly how low down it goes, remains open to quantitative question and improvement of radiosonde datasets. But I believe the fundamental point we made in 2005 remains true: the temperature trends in the lower stratosphere in the tropics are, even with corrections, quite comparable to that seen at other latitudes. We can now say it is surely linked to the now-well-observed trends in ozone there. The new paper further shows that you don't have to have ozone trends at 100 mbar to have a cooling there, due to down-welling longwave, possibly lower down still. Whether enhanced upwelling is a factor is a central question.

No global general circulation model can possibly be expected to simulate this correctly unless it has interactive ozone, or prescribes an observed tropical ozone trend. The AR4 models did not include this, and any 'discrepancies' are not relevant at all to the issue of the fidelity of those models for global warming. So in closing let me just say that just how low down this effect goes needs more study, but that it does happen and is relevant to the key problem of tropical temperature trends is one that I hope this email has clarified.

Happy new year,
Susan

Susan et al.,

I had also seen the Forster et al paper and was glad to see he had followed up on work and ideas we had discussed some years ago when he was at Reading and from the Exeter workshop. At the time I had done some simple research on whether the stratosphere could affect the tropical troposphere - possibly through convection modification or radiative cooling. I'd done a simple timeseries regression of $T2LT = a * T_{surf} + b * T4 + c$ and got some regression coefficients out that suggested an influence. Now, this was with old and now discredited data and the Fu et al. technique has since superseded it to some extent (or at least cast considerable doubt upon its efficacy) ... it would certainly be hard to prove in a regression what was cause and effect with such broad weighting functions even using T2LT which still isn't *really* independent from T4.

But one thing I did do to try to "prove" the regression result was real is take the composite differences between QBO phases on 45 years of detrended (can't remember exactly how but I think I took differences from decadal filtered data) data from radiosondes (HadAT1 at the time). This showed a really very interesting result and suggested that this communication if it was real went quite far down in to the troposphere and was statistically significant, particularly in those seasons when the ITCZ and QBO were geographically coincident. I attach the slide for interest. I think this is the only scientifically valid part of the analysis that I would stand by today given the rather massive developments since. I doubt that raobs inhomogeneities could explain the plot result as they project much more onto the trend than they would onto this type of analysis.

The cooling stratosphere may really have an influence even quite low down if this QBO composite technique is a good analogue for a cooling stratosphere's impact, and timeseries regression analysis supports it in some obs (it would be interesting to repeat such an analysis with the newer obs but I don't have time). A counter, however, is that surely the models do radiation so those with ozone loss should do a good job of this effect. This could be checked in Ben's ensemble in a poor man's sense at least because some have ozone depletion and some don't.

The only way this could be a real factor not picked by the models, I concluded at the time, is if models are far too keen to trigger convection and that any real-world increased radiative cooling efficiency effect is masked in the models because they convect far too often and regain CAPE closure as a condition.

On another matter, we seem to be concentrating entirely on layer-average temperatures. This is fine, but we know from CCSP these show little in the way of differences. The key, and much harder test is to capture the differences in behaviour between layers / levels - the "amplification" behaviour. This was the focus of Santer et al. and I still believe is the key scientific question given that each model realisation is inherently so different but that we believe the physics determining the temperature profile to be the key test that has to be answered. Maybe we need to step back and rephrase the question in terms of the physics rather than aiming solely to rebutt Douglass et al? In this case the key physical questions in my view would be:

1. Why is there such strong evidence from sondes for a minima at c. 500? Is this because it is near the triple point of water in the tropics? Or at the top of the shallow convection? Or simply an artefact? [I don't have any good ideas how we would answer the first two of these questions]

2. Is there really a stratospheric radiative influence? If so, how low does it go? What is the cause? Are the numbers consistent with the underlying governing physics or simply an artefact of residual obs errors?

3. Can any models show trend behaviour that deviates from a SALR on multi-decadal timescales? If so, what is it about the model that causes this effect? Physics? Forcings? Phasing of natural variability? Is it also true on shorter timescales in this model?

It seems to me that trying to do an analysis based upon such physical understanding / questions will clarify things far better than simply doing another set of statistical analysis. I'm still particularly interested if #2 is really true in the raobs (its not possible to do with satellites I suspect, but if it is true it means we need to massively rethink Fu et al. type analysis at least in the tropics) and would be interested in helping someone follow up on that ... I think in the future the Forster et al paper may be seen as the more scientifically significant result when Douglass et al is no longer cared about ...

Happy new year to you all.

Peter

Phil

Thanks for the Benestad reference, which I hadn't seen and will read with interest.

Please keep me in the loop on your reprints.

I'm aware of the work with Dave Thompson, which is very interesting.

Happy new year to you too.

We can all look back on 2007 as a year in which we, the scientists, did a fantastic job.

best

Susan

<x-flowed>
Dear Tom,

In the end, I decided to test the significance of trends in the $O(t)$ minus $M(t)$ difference time series, as you and John Lanzante have suggested. I still think that this "difference series test" is more appropriate when one is operating on a pair of time series with correlated variability (for example, if you wished to test whether an observed tropical T2LT trend was significantly different from the T2LT trend simulated in an AMIP experiment). But you and John convinced me that our response to Douglass et al. would be strengthened by using several different approaches to address the statistical significance of differences between modeled and observed temperature trends.

The Tables given below show the results from two different types of test. You've already seen the "TYPE1" or "PAIRED TREND" results. These involve $b\{0\}$ and $b\{M\}$, which represent any single pair of Observed and Modeled trends, with standard errors $s\{b0\}$ and $s\{bM\}$ (which are adjusted for temporal autocorrelation effects). As in our previous work (and as in related work by John Lanzante), we define the normalized trend difference d as:

$$d1 = (b\{0\} - b\{M\}) / \text{sqrt}[(s\{b0\})^2 + (s\{bM\})^2]$$

Under the assumption that $d1$ is normally distributed, values of $d1 > +1.96$ or < -1.96 indicate observed-minus-model trend differences that are significant at the 5% level, and one can easily calculate a p-value for each value of d . These p-values for the 98 pairs of trend tests (49 involving UAH data and 49 involving RSS data) are what we use for determining the total number of "hits", or rejections of the null hypothesis of no significant difference between modeled and observed trends. I note that each test is two-tailed, since we have no information a priori about the "direction" of the model trend (i.e., whether we expect the simulated trend to be significantly larger or smaller than observed).

The "TYPE2" results are the "DIFFERENCE SERIES" tests. These involve

$O(t)$ and $M(t)$, which represent any single pair of modeled and observed layer-averaged temperature time series. One first defines the difference time series $D(t) = O(t) - M(t)$, and then calculates the trend $b\{D\}$ in $D(t)$ and its adjusted standard error, $s\{bD\}$. The test statistic is then simply $d2 = b\{D\} / s\{bD\}$. As in the case of the "PAIRED TREND" tests, we assume that $d2$ is normally distributed, and then calculate p-values for the 98 pairs of difference series tests.

As I mentioned in a previous email, the interpretation of the "DIFFERENCE SERIES" tests is a little complicated. Over half (35) of the 49 model simulations examined in the CCSP report include some form of volcanic forcing. In these 35 cases, differencing the $O(t)$ and $M(t)$ time series reduces the amplitude of this externally-forced component in $D(t)$. This will tend to reduce the overall temporal variability of $D(t)$, and hence reduce $s\{bD\}$, the standard error of the trend in $D(t)$. Such noise reduction should make it easier to identify true differences in the anthropogenically-forced components of $b\{O\}$ and $b\{D\}$. But since the internally-generated variability in $O(t)$ and $M(t)$ is uncorrelated, differencing $O(t)$ and $M(t)$ has the opposite effect of amplifying the noise, thus inflating $s\{bD\}$ and making it more difficult to identify model-versus-observed trend differences.

The results given below show that the "PAIRED TREND" and "DIFFERENCE SERIES" tests yield very similar rejection rates of the null hypothesis. The bottom line is that, regardless of which test we use, which significance level we stipulate, which observational dataset we use, or which atmospheric layer we focus on, there is no evidence to support Douglass et al.'s assertion that all "UAH and RSS satellite trends are inconsistent with model results".

REJECTION RATES FOR STIPULATED 5% SIGNIFICANCE LEVEL

| Test type | No. of tests | T2 "Hits" | T2LT "Hits" |
|-------------------------|--------------|-----------|-------------|
| 1. OBS-vs-MODEL (TYPE1) | 49 x 2 (98) | 2 (2.04%) | 1 (1.02%) |
| 2. OBS-vs-MODEL (TYPE2) | 49 x 2 (98) | 2 (2.04%) | 2 (2.04%) |

REJECTION RATES FOR STIPULATED 10% SIGNIFICANCE LEVEL

| Test type | No. of tests | T2 "Hits" | T2LT "Hits" |
|-------------------------|--------------|-----------|-------------|
| 1. OBS-vs-MODEL (TYPE1) | 49 x 2 (98) | 4 (4.08%) | 2 (2.04%) |
| 2. OBS-vs-MODEL (TYPE2) | 49 x 2 (98) | 3 (3.06%) | 3 (3.06%) |

REJECTION RATES FOR STIPULATED 20% SIGNIFICANCE LEVEL

| Test type | No. of tests | T2 "Hits" | T2LT "Hits" |
|-------------------------|--------------|-------------|-------------|
| 1. OBS-vs-MODEL (TYPE1) | 49 x 2 (98) | 7 (7.14%) | 5 (5.10%) |
| 2. OBS-vs-MODEL (TYPE2) | 49 x 2 (98) | 10 (10.20%) | 7 (7.14%) |

As I've mentioned in previous emails, I think it's a little tricky to figure out the null distribution of rejection rates - i.e., the distribution that might be expected by chance alone. My gut feeling is that this is easiest to do by generating distributions of the $d1$ and $d2$ statistics using model control run data only. Use of Monte Carlo procedures gets into issues of whether one should use "block resampling", and attempt to preserve the characteristic decorrelation times of the model and observational data being tested, etc., etc.

Thanks very much to all of you for your advice and comments. I still believe that there is considerable merit in a brief response to Douglass et al. I think this could be done relatively quickly. From my perspective, this response should highlight four issues:

- 1) It should identify the flaws in the statistical approach used by Douglass et al. to compare modeled and observed trends.
- 2) It should do the significance testing properly, and report on the results of "PAIRED TREND" and "DIFFERENCE SERIES" tests.
- 3) It should show something similar to the figure that Leo recently distributed (i.e., zonal-mean trend profiles in various versions of the RAOBCORE data), and highlight the fact that the structural uncertainty in sonde-based estimates of tropospheric temperature change is much larger than was claimed in Douglass et al.
- 4) It should note and discuss the considerable body of "complementary evidence" supporting the finding that the tropical lower troposphere has warmed over the satellite era.

With best regards,

Ben

Dear Phil,

I was very sorry to hear of Hannah's health problems. I hope she makes a speedy recovery. Please give her my best wishes, and tell her that there is life and love after divorce!

My Mom's cataract surgery did not go very well, and it looks like she won't be able to drive any longer. Nick and I are best placed to take care of her, so I'm trying to persuade her to move to California. So there could be some big changes in our lives in 2008.

Nick has turned into a fine young man. It's going to be tough to see him leave for college in three and a half years.

I share your frustration about having to devote valuable time to the rebuttal of crappy papers. Douglass et al. is truly awful. It should never have been published. Any residual respect I might have had for John Christy has now vanished. I can't believe that he's a coauthor on this garbage.

Best wishes to all of you from rainy Livermore,

Ben

Kathryn,

I did talk to the Metro yesterday - no idea what they used. Maybe a few will have read it - before copies are tossed around on the tube!

Added Geoff on this email.

Ag has answered the second question. I may come back to that after trying to answer the first part.

There are two aspects to the WG work we're doing. The first, which I've mentioned on a number of occasions, is to prove that the perturbation process used with the WG works. Colin Harpham sent around a load of plots to Chris/Ag/David/Geoff just before Christmas. I have a rough draft of a paper on this which I sent to Chris yesterday. This involves the UKCIP08 WG, but is totally independent of the change factors David is developing for UKCIP08. This uses some earlier HadRM3 model runs. The WG is fit to 10 grid box series across the UK and then perturbed according to the differences between the future model integrations and the control runs. We then generate future weather and show that its characteristics are similar to what HadRM3 got directly. This has used the same change factors (same variables) but from a different set of RCM runs.

The whole purpose of this exercise is to show that the perturbation process works. The only way we can test this is to use RCM model runs - because they have future runs with a big climate change. We can't use past weather data as it doesn't have enough of a climate change. This is validation of the perturbation process.

We can additionally validate the WG using observational data - which we've done earlier.

Return to Q2. Ag has said how the model variants get chosen. The model variants used have a variety of ways of being chosen. Let's say we start with the 50th percentile for rainfall. We select all model variants between 45 and 55%. Then we want temperature at the 90th percentile. We then do a second selection of the variants already selected that have temperature changes between 85 and 95%. As we had initially 10,000 variants, the first selection reduced this to a 1000 (as we chose 10% of them). The second selection reduced this to 100 (as we've again chosen only 10% of them).

Now with these 100 variants, most users will average the change factors (from David) across these 100. These average change factors (which will approximately be at the 50% and 90% value for precipitation and temperature respectively) get passed to the WG. The WG then simulates 100 runs of 30 years - for the already pre-selected location (small area) and future period.

There are obviously loads of permutations as we will be allowing users to select all percentile levels (singly for temperature or precipitation) or jointly for both from 5 to 95 % in steps of 5.

The percentile levels can be chosen based on seasons (4) and years (1). If you select summer say, users will also get the rest of the year - using the change factors that

go along with those for the selected model variants.

Another possibility is to select one model variant within the chosen percentile bands and pass these change factors to the WG.

There are other possibilities, but I think we've limited the choices to these two. The other possibility was a variant (can't think of a better word here - but not related to the model variants) to the first. As you have 100 chosen model variants in this example, you could choose one at random or allow each of the 100 WG integrations to be based on a different one of the model variants. These generated sequences will likely have greater variability than that based on the average of the 100 or that based on the single model variant.

I think this may open up a can of worms with Ag when he reads it !

Whichever of these are chosen, the use should still run the WG for 100 30-year sequences.

I think I've made the last bit on model variant selection complicated and haven't gone back to look at what Ag has written in the User Guidance. It ought to tell you how the change factors that the WG needs will get selected.

Cheers
Phil

At 10:07 04/01/2008, Humphrey, Kathryn (CEOSA) wrote:

Hi Ag,

Yes that makes perfect sense in terms of selecting one/several model variant/s, thanks. I'm still a bit confused about the utility of random sampling though as this won't give you results for a particular probability level (will it?). I think Phil was going to get back to me on this as well as the change factors question.

Phil, I liked your quote in the Metro this morning!

Hi Kathryn,

I can comment on your second question. Here is my understanding:

Firstly, users must run a minimum of 100 WG runs regardless of which ones they run. This is to enforce the use of a "probabilistic" approach.

Selection by model variant will only make sense once a user has produced some runs. After any run they will have access to the model variant IDs that were used. The use case that gave rise to us including "selection by model variant ID" was as follows:

1. Person X does some WG runs (sampling by whatever method she chooses).
2. She uses/analyses a set of runs to produce some interesting results.
3. She is keen to do more/different analyses using the model variants that represented that part of parameter space.
4. She has the list of model variant IDs so she can publish these so that others can use them or she can re-use them herself in other experiments.
5. Person Y can read about what Person X did and re-produce exactly her results, or use the same set of interesting model variants for some other experiments.

Does that make sense?

Cheers,

Ag

Subject: Questions on the weather generator
Phil/Chris/Ag,

I'm putting together a "quick and easy" presentation on the UKCIP08 methodology for Defra officials to give them some idea of how it's all done so they can better appreciate what's its potential uses may, and may not, be. However I'm getting stuck still on some of the WG methodology! Can you help? (I'm not planning on telling them this level of detail about the WG but am just bothered by the issues below).

I'm firstly confused about the RCM change factors; are you using these to validate the WG runs (which I do understand) or to generate them (which I don't as I thought they were being generated using the data in final PDFs themselves)?

And I'm still confused about the reasons for allowing users to select runs by model variant. I think by model variant you mean each perturbed version of HadCM3 or other single model run or emulator result that creates a point in parameter space. Is this right? If so then I understand why you can't run your WG on all model variants (too many) so selecting a random sample is a representation of parameter space. But my initial understand of how the WG works is that you pick a point on the PDF (say 50th percentile) with a given probability and run the WG for that point. But this doesn't make sense if you are allowing users to select random/ single model variants seasons etc. because these won't reflect a particular percentile. Maybe it's the case that you don't need a particular percentile for whatever use the WG data is for, but if you don't know, how do you know how likely your WG output is and therefore what to do with the result in terms of planning?

Apologies for my ignorance and assistance would be gratefully received!

Kind Regards,

Kathryn

Subject: Update on response to Douglass et al.
Date: Wed, 09 Jan 2008 19:52:15 -0800
Reply-to: santer1@llnl.gov

<x-flowed>

Dear folks,

I just wanted to update you on my progress in formulating a response to the Douglass et al. paper in the International Journal of Climatology (IJC). There have been several developments.

First, I contacted Science to gauge their level of interest in publishing a response to Douglass et al. I thought it was worthwhile to "test the water" before devoting a lot of time to the preparation of a manuscript for submission to Science. I spoke with Jesse Smith, who handles most of the climate-related papers at Science magazine.

The bottom line is that, while Science is interested in this issue (particularly since Douglass et al. are casting doubt on the findings of the 2005 Santer et al. Science paper), Jesse Smith thought it was highly unlikely that Science would carry a rebuttal of work published in a different journal (IJC). Regretfully, I agree. Our response to Douglass et al. does not contain any fundamentally new science - although it does contain some new and interesting work (see below).

It's an unfortunate situation. Singer is promoting the Douglass et al. paper as a startling "new scientific evidence", which undercuts the key conclusions of the IPCC and CCSP Reports. Christy is using the Douglass et al. paper to argue that his UAH group is uniquely positioned to perform "hard-nosed" and objective evaluation of model performance, and that it's dangerous to leave model evaluation in the hands of biased modelers. Much as I would like to see a high-profile rebuttal of Douglass et al. in a journal like Science or Nature, it's unlikely that either journal will publish such a rebuttal.

So what are our options? Personally, I'd vote for GRL. I think that it is important to publish an expeditious response to the statistical flaws in Douglass et al. In theory, GRL should be able to give us the desired fast turnaround time. Would GRL accept our contribution, given that the Douglass et al. paper was published in IJC? I think they would - we've

done a substantial amount of new work (see below), and can argue, with some justification, that our contribution is more than just a rebuttal of Douglass et al.

Why not go for publication of a response in IJC? According to Phil, this option would probably take too long. I'd be interested to hear any other thoughts you might have on publication options.

Now to the science (with a lower-case "s"). I'm appending three candidate Figures for a GRL paper. The first Figure was motivated by discussions I've had with Karl Taylor and Tom Wigley. It's an attempt to convey the differences between our method of comparing observed and simulated trends (panel A) and the approach used by Douglass et al. (panel B).

In our method, we account for both statistical uncertainties in fitting least-squares linear trends to noisy, temporally-autocorrelated data and for the effects of internally-generated variability. As I've described in previous emails, we compare each of the 49 simulated T2 and T2LT trends (i.e., the same multi-model ensemble used in our 2005 Science paper and in the 2006 CCSP Report) with observed T2 and T2LT trends obtained from the RSS and UAH groups. Our 2-sigma confidence intervals on the model and observed trends are estimated as in Santer et al. (2000). [Santer, B.D., T.M.L. Wigley, J.S. Boyle, D.J. Gaffen, J.J. Hnilo, D. Nychka, D.E. Parker, and K.E. Taylor, 2000: Statistical significance of trends and trend differences in layer-average atmospheric temperature time series, *J. Geophys. Res.*, 105, 7337-7356]

The method that Santer et al. (2000) used to compute "adjusted" trend confidence intervals accounts for the fact that, after fitting a trend to T2 or T2LT data, the regression residuals are typically highly autocorrelated. If this autocorrelation is not accounted for, one could easily reach incorrect decisions on whether the trend in an individual time series is significantly different from zero, or whether two time series have significantly different trends. Santer et al. (2000) accounted for temporal autocorrelation effects by estimating $r\{1\}$, the lag-1 autocorrelation of the regression residuals, using $r\{1\}$ to calculate an effective sample size $n\{e\}$, and then using $n\{e\}$ to determine an adjusted standard error of the least-squares linear trend. Panel A of Figure 1 shows the 2-sigma "adjusted" standard errors for each individual trend. Models with excessively large tropical variability (like FGOALS-g1.0 and GFDL-CM2.1) have large adjusted standard errors. Models with coarse-resolution OGCMs and low-amplitude ENSO variability (like the GISS-AOM) have smaller than observed adjusted standard errors. Neglect of volcanic forcing (i.e., absence of El Chichon and Pinatubo-induced temperature variability) can also contribute to smaller than observed standard errors, as in CCCma-CGCM3.1(T47).

The dark and light grey bars in Panel A show (respectively) the 1- and 2-sigma standard errors for the RSS T2LT trend. As is visually obvious, 36 of the 49 model trends are within 1 standard error of the RSS trend, and 47 of the 49 model trends are within 2 standard errors of the RSS trend.

I've already explained our "paired trend test" procedure for calculating the statistical significance of the model-versus-observed trend differences. This involves the normalized trend difference d_1 :

$$d_1 = (b\{O\} - b\{M\}) / \sqrt{[(s\{bO\})^{**2} + (s\{bM\})^{**2}]}$$

where $b\{O\}$ and $b\{M\}$ represent any single pair of Observed and Modeled trends, with adjusted standard errors $s\{bO\}$ and $s\{bM\}$.

Under the assumption that d_1 is normally distributed, values of $d_1 > +1.96$ or < -1.96 indicate observed-minus-model trend differences that are significant at some stipulated significance level, and one can easily calculate a p-value for each value of d_1 . These p-values for the 98 pairs of trend tests (49 involving UAH data and 49 involving RSS data) are what we use for determining the total number of "hits", or rejections of the null hypothesis of no significant difference between modeled and observed trends. I note that each test is two-tailed, since we have no information a priori about the "direction" of the model trend (i.e., whether we expect the simulated trend to be significantly larger or smaller than observed).

REJECTION RATES FOR "PAIRED TREND TESTS, OBS-vs-MODEL

| Stipulated sign. level | No. of tests | T2 "Hits" | T2LT "Hits" |
|------------------------|--------------|-----------|-------------|
| 5% | 49 x 2 (98) | 2 (2.04%) | 1 (1.02%) |
| 10% | 49 x 2 (98) | 4 (4.08%) | 2 (2.04%) |
| 15% | 49 x 2 (98) | 7 (7.14%) | 5 (5.10%) |

Now consider Panel B of Figure 1. It helps to clarify the differences between the Douglass et al. comparison of model and observed trends and our own comparison. The black horizontal line ("Multi-model mean trend") is the T2LT trend in the 19-model ensemble, calculated from model ensemble mean trends (the colored symbols). Douglass et al.'s "consistency criterion", $\sigma\{SE\}$, is given by:

$$\sigma\{SE\} = \sigma / \sqrt{N - 1}$$

where σ is the standard deviation of the 19 ensemble-mean trends, and N is 19. The orange and yellow envelopes denote the 1- and 2- $\sigma\{SE\}$ regions.

Douglass et al. use $\sigma\{SE\}$ to decide whether the multi-model mean trend is consistent with either of the observed trends. They conclude that the RSS and UAH trends lie outside of the yellow envelope (the 2- $\sigma\{SE\}$ region), and interpret this as evidence of a fundamental inconsistency between modeled and observed trends. As noted previously,

Douglass et al. obtain this result because they fail to account for statistical uncertainty in the estimation of the RSS and UAH trends. They ignore the statistical error bars on the RSS and UAH trends (which are shown in Panel A). As is clear from Panel A, the statistical error bars on the RSS and UAH trends overlap with the Douglass et al. 2- $\sigma\{SE\}$ region. Had Douglass et al. accounted for statistical uncertainty in estimation of the observed trends, they would have been unable to conclude that all "UAH and RSS satellite trends are

inconsistent with model trends".

The second Figure plots values of our test statistic (d_1) for the "paired trend test". The grey histogram is based on the values of d_1 for the 49 tests involving the RSS T2LT trend and the simulated T2LT trends from 20c3m runs. The green histogram is for the 49 paired trend tests involving model 20c3m data and the UAH T2LT trend. Note that the d_1 distribution obtained with the UAH data is negatively skewed. This is because the numerator of the d_1 test statistic is $b\{0\} - b\{M\}$, and the UAH tropical T2LT trend over 1979-1999 is smaller than most of the model trends (see Figure 1, panel A).

The colored dots are values of the d_1 test statistic for what I referred to previously as "TYPE2" tests. These tests are limited to the M models with multiple realizations of the 20c3m experiment. Here, $M = 11$. For each of these M models, I performed paired trend tests for all C unique combinations of trends pairs. For example, for a model with 5 realizations of the 20c3m experiment, like GISS-EH, $C = 10$. The significance of trend differences is solely a function of "within-model" effects (i.e., is related to the different manifestations of natural internal variability superimposed on the underlying forced response). There are a total of 62 paired trend tests. Note that the separation of the colored symbols on the y-axis is for visual display purposes only, and facilitates the identification of results for individual models.

The clear message from Figure 2 is that the values of d_1 arising from internal variability alone are typically as large as the d_1 values obtained by testing model trends against observational data. The two negative "outlier" values of d_1 for the model-versus-observed trend tests involve the large positive trend in CCCma-CGCM3.1(T47). If you have keen eagle eyes, you'll note that the distribution of colored symbols is slightly skewed to the negative side. If you look at Panel A of Figure 1, you'll see that this skewness arises from the relatively small ensemble sizes. Consider results for the 5-member ensemble of 20c3m trends from the MRI-CGCM2.3.2. The trend in realization 1 is close to zero; trends in realizations 2, 3, 4, and 5 are large, positive, and vary between 0.27 to 0.37 degrees C/decade. So d_1 is markedly negative for tests involving realization 1 versus realizations 2, 3, 4, and 5. If we showed non-unique combinations of trend pairs (e.g., realization 2 versus realization 1, as well as 1 versus 2), the distribution of colored symbols would be symmetric. But I was concerned that we might be accused of "double counting" if we did this....

The third Figure is the most interesting one. You have not seen this yet. I decided to examine how the Douglass et al. "consistency test" behaves with synthetic data. I did this as a function of sample size N , for N values ranging from 19 (the number of models we used in the CCSP report) to 100. Consider the $N = 19$ case first. I generated 19 synthetic time series using an AR-1 model of the form:

$$xt(i) = a_1 * (xt(i-1) - am) + zt(i) + am$$

where a_1 is the coefficient of the AR-1 model, $zt(i)$ is a randomly-generated noise term, and am is a mean (set to zero here).

Here, I set a_1 to 0.86, close to the lag-1 autocorrelation of the UAH T2LT anomaly data. The other free parameter is a scaling term which controls the amplitude of $z_t(i)$. I chose this scaling term to yield a temporal standard deviation of $x_t(i)$ that was close to the temporal standard deviation of the monthly-mean UAH T2LT anomaly data. The synthetic time series had the same length as the observational and model data (252 months), and monthly-mean anomalies were calculated in the same way as we did for observations and models.

For each of these 19 synthetic time series, I first calculated least-squares linear trends and adjusted standard errors, and then performed the "paired trends". The test involves all 171 unique pairs of trends: $b\{1\}$ versus $b\{2\}$, $b\{1\}$ versus $b\{3\}$, ... $b\{1\}$ versus $b\{19\}$, $b\{2\}$ versus $b\{3\}$, etc. I then calculate the rejection rates of the null hypothesis of "no significant difference in trend", for stipulated significance levels of 5%, 10%, and 20%. This procedure is repeated 1000 times, with 1000 different realizations of 19 synthetic time series. We can therefore build up a distribution of rejection rates for $N = 19$, and then do the same for $N = 20$, etc.

The "paired trend" results are plotted as the blue lines in Figure 3. Encouragingly, the percentage rejections of the null hypothesis are close to the theoretical expectations. The 5% significance tests yield a rejection rate of a little over 6%; 10% tests have a rejection rate of over 11%, and 20% tests have a rejection rate of 21%. I'm not quite sure why this slight positive bias arises. This bias does show some small sensitivity (1-2%) to choice of the a_1 parameter and the scaling term. Different choices of these parameters can give rejection rates that are closer to the theoretical expectation. But my parameter choices for the AR-1 model were guided by the goal of generating synthetic data with roughly the same autocorrelation and variance properties as the UAH data, and not by a desire to get as close as I possibly could to the theoretical rejection rates.

So why is there a small positive bias in the empirically-determined rejection rates? Perhaps Francis can provide us with some guidance here. Karl believes that the answer may be partly linked to the skewness of the empirically-determined rejection rate distributions. For example, for the $N = 19$ case, and for 5% tests, values of rejection rates in the 1000-member distribution range from a minimum of 0 to a maximum of 24%, with a mean value of 6.7% and a median of 6.4%. Clearly, the minimum value is bounded by zero, but the maximum is not bounded, and in rare cases, rejection rates can be quite large, and influences the mean. This inherent skewness must make some contribution to the small positive bias in rejection rates in the "paired trends" test.

What happens if we naively perform the paired trends test WITHOUT adjusting the standard errors of the trends for temporal autocorrelation effects? Results are shown by the black lines in Figure 3. If we ignore temporal autocorrelation, we get the wrong answer. Rejection rates for 5% tests are 60%!

We did not publish results from any of these synthetic data experiments in our 2000 JGR paper. In retrospect, this is a bit of a shame, since

Figure 3 nicely shows that the adjustment for temporal autocorrelation effects works reasonably well, while failure to adjust yields completely erroneous results.

Now consider the red lines in Figure 3. These are the results of applying the Douglass et al. "consistency test" to synthetic data. Again, let's consider the $N = 19$ case first. I calculate the trends in all 19 synthetic time series. Let's consider the first of these 19 time series as the surrogate observations. The trend in this time series, $b\{1\}$, is compared with the mean trend, $b\{\text{Synth}\}$, computed from the remaining 18 synthetic time series. The Douglass $\sigma\{SE\}$ is also computed from these 18 remaining trends. We then form a test statistic $d2 = (b\{1\} - b\{\text{Synth}\}) / \sigma\{SE\}$, and calculate rejection rates for the null hypothesis of no significant difference between the mean trend and the trend in the surrogate observations. This procedure is then repeated with the trend in time series 2 as the surrogate observations, and $b\{\text{Synth}\}$ and $\sigma\{SE\}$ calculated from time series 1, 3, 4, ..19. This yields 19 different tests of the null hypothesis. Repeat 1,000 times, and build up a distribution of rejection rates, as in the "paired trends" test.

The results are truly alarming. Application of the Douglass et al. "consistency test" to synthetic data - data generated with the same underlying AR-1 model! - leads to rejection of the above-stated null hypothesis at least 65% of the time (for $N = 19$, 5% significance tests).

As expected, rejection rates for the Douglass consistency test rise as N increases. For $N = 100$, rejection rates for 5% tests are nearly 85%. As my colleague Jim Boyle succinctly put it when he looked at these results, "This is a pretty hard test to pass".

I think this nicely illustrates the problems with the statistical approach used by Douglass et al. If you want to demonstrate that modeled and observed temperature trends are fundamentally inconsistent, you devise a fundamentally flawed test is very difficult to pass.

I hope to have a first draft of this stuff written up by the end of next week. If Leo is agreeable, Figure 4 of this GRL paper would show the vertical profiles of tropical temperature trends in the various versions of the RAOBCORE data, plus model results.

Sorry to bore you with all the gory details. But as we've seen from Douglass et al., details matter.

With best regards,

Ben

Dear Ben,

Thank you for this detailed update of your work. A few thoughts for your consideration ...

Where to submit this: Although I understand your and Phil's reluctance to try IJC, it seems to me that, despite the new work presented, this is really a comment on Douglass et al. and so rightly belongs in IJC. If you suspect the review and publication process there is unacceptably long, perhaps this should be confirmed by inquiring with the editor, as a professional courtesy. Decide in advance what you'd consider a reasonable turn-around time, and if the editor says it will take longer, going with another journal makes sense.

Figures: They look great. As usual, you've done a super job telling the story in pictures. One suggestion would be to indicate in Fig. 3 which test, or trio of tests, is the most appropriate. Now it is shown as the blue curves, but I'd suggest making these black (and the black ones blue) and thicker than the rest. That way those readers who just skim the paper and look at the figures will get the message quickly.

Observations: Have you considered including results from HadAT and RATPAC as well as RAOBCOR? For even greater completeness, a version of RATPAC pared down based on the results of Randel and Wu could be added, as could Steve Sherwood's adjusted radiosonde data. I'd suggest adding results from these datasets to your Fig. 1, not the planned Fig 4, which I gather is meant to show the differences in versions of RAOBCOR and the impact of Douglass et al.'s choice to use and early version.

With best wishes,
Dian

Dear Phil,

If you get a chance, could you call me up at work (+1 925 423-3364) to talk about the "IJC publication" option? I'd really like to discuss that with you.

With best regards,

Ben

<x-flowed>

Dear Tim,

Thanks very much for your email. I greatly appreciate the additional information that you've given me. I am a bit conflicted about what we should do.

IJC published a paper with egregious statistical errors. Douglass et al. was essentially a commentary on work by myself and colleagues - work that had been previously published in Science in 2005 and in Chapter 5 of the first U.S. CCSP Report in 2006. To my knowledge, none of the authors or co-authors of the Santer et al. Science paper or of CCSP 1.1 Chapter 5 were used as reviewers of Douglass et al. I am assuming that, when he submitted his paper to IJC, Douglass specifically requested that certain scientists should be excluded from the review process. Such an approach is not defensible for a paper which is largely a comment on previously-published work.

It would be fair and reasonable to give IJC the opportunity to "set the record straight", and correct the harm they have done by publication of Douglass et al. I use the word "harm" advisedly. The author and coauthors of the Douglass et al. IJC paper are using this paper to argue that "Nature, not CO₂, rules the climate", and that the findings of Douglass et al. invalidate the "discernible human influence" conclusions of previous national and international scientific assessments.

Quick publication of a response to Douglass et al. in IJC would go some way towards setting the record straight. I am troubled, however, by the very real possibility that Douglass et al. will have the last word on this subject. In my opinion (based on many years of interaction with these guys), neither Douglass, Christy or Singer are capable of admitting that their paper contained serious scientific errors. Their "last word" will be an attempt to obfuscate rather than illuminate. They are not interested in improving our scientific understanding of the nature and causes of recent changes in atmospheric temperature. They are

solely interested in advancing their own agendas. It is telling and troubling that Douglass et al. ignored radiosonde data showing substantial warming of the tropical troposphere - data that were in accord with model results - even though such data were in their possession. Such behaviour constitutes intellectual dishonesty. I strongly believe that leaving these guys the last word is inherently unfair.

If IJC are interested in publishing our contribution, I believe it's fair to ask for the following:

1) Our paper should be regarded as an independent contribution, not as a comment on Douglass et al. This seems reasonable given i) The substantial amount of new work that we have done; and ii) The fact that the Douglass et al. paper was not regarded as a comment on Santer et al. (2005), or on Chapter 5 of the 2006 CCSP Report - even though Douglass et al. clearly WAS a comment on these two publications.

2) If IJC agrees to 1), then Douglass et al. should have the opportunity to respond to our contribution, and we should be given the chance to reply. Any response and reply should be published side-by-side, in the same issue of IJC.

I'd be grateful if you and Phil could provide me with some guidance on 1) and 2), and on whether you think we should submit to IJC. Feel free to forward my email to Glenn McGregor.

With best regards,

Ben

Bader" <bader2@llnl.gov>, "'Francis W. Zwiers'" <francis.zwiers@ec.gc.ca>, Frank Wentz <frank.wentz@remss.com>, Leopold Haimberger <leopold.haimberger@univie.ac.at>, Melissa Free <melissa.free@noaa.gov>, "Michael C. MacCracken" <mmaccrac@comcast.net>, Phil Jones <p.jones@uea.ac.uk>, Steve Sherwood <Steven.Sherwood@yale.edu>, Steve Klein <klein21@mail.llnl.gov>, 'Susan Solomon' <ssolomon@al.noaa.gov>, Tim Osborn <t.osborn@uea.ac.uk>, Gavin Schmidt <gschmidt@giss.nasa.gov>, "Hack, James J." <jhack@ornl.gov>

All,

as it happens I am preparing a figure precisely as Dian suggested. This has only been possible due to substantial efforts by Leo in particular, but all the other dataset providers also. I wanted to give a feel for where we are at although I want to tidy this substantially if we were to use it. To do this I've taken every single scrap of info I have in my possession that has a status of at least submitted to a journal. I have considered the common period of 1979-2004. So, assuming you are all sitting comfortably:

Grey shading is a little cheat from Santer et al using a trusty ruler. See Figure 3.B in this paper, take the absolute range of model scaling factors at each of the heights on the y-axis and apply this scaling to HadCRUT3 tropical mean trend denoted by the star at the surface. So, if we assume HadCRUT3 is correct then we are aiming for the grey shading or not depending upon one's pre-conceived notion as to whether the models are correct.

Red is HadAT2 dataset.

black dashed is the raw data used in Titchner et al. submitted (all tropical stations with a 81-2000 climatology)

Black whiskers are median, inter-quartile range and max / min from Titchner et al. submission. We know, from complex error-world assessments, that the median under-cooks the required adjustment here and that the truth may conceivably lie (well) outside the upper limit.

Bright green is RATPAC

Then, and the averaging and trend calculation has been done by Leo here and not me so any final version I'd want to get the raw gridded data and do it exactly the same way. But for the raw raobs data that Leo provided as a sanity check it seems to make a miniscule (<0.05K/decade even at height) difference:

Lime green: RICH (RAOBCORE 1.4 breaks, neighbour based adjustment

estimates)

Solid purple: RAOBCORE 1.2
Dotted purple: RAOBCORE 1.3
Dashed purple: RAOBCORE 1.4

I am also in possession of Steve's submitted IUK dataset and will be adding this trend line shortly.

I'll be adding a legend in the large white space bottom left.

My take home is that all datasets are heading the right way and that this reduces the probability of a discrepancy. Compare this with Santer et al. Figure 3.B.

I'll be using this in an internal report anyway but am quite happy for it to be used in this context too if that is the general feeling. Or for Leo's to be used. Whatever people prefer.

Peter

Subject: An issue/problem with Tim's idea !!!!!!!
Date: Thu Jan 10 16:14:28 2008

Ben,

Tim's idea is a possibility. I've not always got on that well great with Glenn McGregor, but Tim seems to have a reasonable rapport with him. Dian has suggested that this would be the best route - it is the logical one. I also think that Glenn would get quick reviews, as Tim thinks he realises he's made a mistake.

Tim has let me into part of secret. Glenn said the paper had two reviews - one positive, the other said it wasn't great, but would leave it up to the editor's discretion. This is why Glenn knows he made the wrong choice.

The problem !! The person who said they would leave it to the editor's discretion is on your email list! I don't know who it is - Tim does - maybe they have told you? I don't want to put pressure on Tim. He doesn't know I'm sending this. It isn't me by the way - nor Tim ! Tim said it was someone who hasn't contributed to the discussion - which does narrow the possibilities down!

Tim/Glenn discussed getting quick reviews. Whoever this person is they could be the familiar reviewer - and we could then come up with another reasonable name (Kevin - he does everything at the speed of light) as the two reviewers.

Colour in IJC costs a bit, but I'm sure we can lean on Glenn. Also we can just have colour in the pdf.

I'll now send a few thoughts on the figures!

Cheers

Phil

Subject: Re: Update on response to Douglass et al.

At 03:52 10/01/2008, Ben Santer wrote:

...Much as I would like to see a high-profile rebuttal of Douglass et al. in a journal like Science or Nature, it's unlikely that either journal will publish such a rebuttal. So what are our options? Personally, I'd vote for GRL. I think that it is important to publish an expeditious response to the statistical flaws in Douglass et al. In theory, GRL should be able to give us the desired fast turnaround time... Why not go for publication of a response in IJC? According to Phil, this option would probably take too long. I'd be interested to hear any other thoughts you might have on publication options.

Hi Ben and Phil,

as you may know (Phil certainly knows), I'm on the editorial board of IJC. Phil is right that it can be rather slow (though faster than certain other climate journals!). Nevertheless, IJC really is the preferred place to publish (though a downside is that Douglass et al. may have the opportunity to have a response considered to accompany any comment).

I just contacted the editor, Glenn McGregor, to see what he can do. He promises to do everything he can to achieve a quick turn-around time (he didn't quantify this) and he will also "ask (the publishers) for priority in terms of getting the paper online asap after the authors have received proofs". He genuinely seems keen to correct the scientific record as quickly as possible.

He also said (and please treat this in confidence, which is why I emailed to you and Phil only) that he may be able to hold back the hardcopy (i.e. the print/paper version) appearance of Douglass et al., possibly so that any accepted Santer et al. comment could appear alongside it. Presumably depends on speed of the review process.

If this does persuade you to go with IJC, Glenn suggested that I could help (because he is in Kathmandu at present) with achieving the quick turn-around time by identifying in advance reviewers who are both suitable and available. Obviously one reviewer could be someone who is already familiar with this discussion, because that would enable a fast review - i.e., someone on the email list you've been using - though I don't know which of these people you will be asking to be co-authors and hence which won't be available as possible reviewers. For objectivity the other reviewer would need to be independent, but you could still suggest suitable names.

Well, that's my thoughts... let me know what you decide.

Cheers

Tim

Ben et al,
As Dian has said Ben's diagrams are as usual great! I also like the one that Peter has just sent around as that illustrates the issue with the various RAOBCORE versions. Although I still think they should have used HadCRUT3v for the surface, I know HadCRUT2v shows much the same. What this figure shows is the differences between the various sonde datasets. Dian/Peter also make the point that there are other new datasets to be added - so the sondes are very much still work in progress. I know you will point out all the analytical/statistical issues see the series brings home the issues better. I know you could add the values to your Fig1, a plot like this is much better.
In the email Ben, you seem to have written much of the response! Whichever route you go down (GRL/IJC) the text can't be too long. I would favour copious captions, and even an Appendix, to get the main points across quickly.
Cheers
Phil

<x-flowed>

Dear Leo,

Thanks very much for your email. I can easily make the observations a bit more prominent in Figure 1. As you can see from today's (voluminous!) email traffic, I've received lots of helpful suggestions regarding improvements to the Figures. I'll try to produce revised versions of the Figures tomorrow.

On the autocorrelation issue: The models have a much larger range of lag-1 autocorrelation coefficients (0.66 to 0.95 for T2LT, and 0.69 to 0.95 for T2) than the UAH or RSS data (which range from 0.87 to 0.89). I was concerned that if we used the model lag-1 autocorrelations to guide the choice of AR-1 parameter in the synthetic data analysis, Douglass and colleagues would have an easy opening for criticising us ("Aha! Santer et al. are using model results to guide them in their selection of the coefficients for their AR-1 model!") I felt that it was much more difficult for Douglass et al. to criticize what we've done if we used UAH data to dictate our choice of the AR-1 parameter and the "scaling factor" for the amplitude of the temporal variability.

As you know, my personal preference would be to include in our response to Douglass et al. something like the Figure 4 that Peter has produced. While inclusion of a Figure 4 is not essential for the purpose of illuminating the statistical flaws in the Douglass et al. "consistency test", such a Figure would clearly show the (currently large) structural uncertainties in radiosonde-based estimates of the vertical profile of atmospheric temperature changes. I think this is an important point, particularly in view of the fact that Douglass et al. failed to discuss versions 1.3 and 1.4 of your RAOBCORE data - even though they had information from those datasets in their possession.

However, I fully agree with Tom's comment that we don't want to do anything to "steal the thunder" from ongoing efforts to improve sonde-based estimates of atmospheric temperature change, and to better quantify structural uncertainties in those estimates. Your group,

together with the groups at the Hadley Centre, Yale, NOAA ARL and NOAA GFDL, deserve great credit for making significant progress on a difficult, time-consuming, yet important problem.

I guess the best solution is to leave this decision up to all of you (the radiosonde dataset developers). I'm perfectly happy to include a version of Figure 4 in our response to Douglass et al. If we do go with inclusion of a Figure 4, you, Peter, Dian, Melissa, Steve Sherwood and John should decide whether you feel comfortable providing radiosonde data for such a Figure. I will gladly abide by your decisions. As you note in your email, our use of a Figure 4 would not preclude a more detailed and thorough comparison of simulated and observed amplification in some later publication.

Once again, thanks for all your help with this project, Leo.

With best regards,

Ben

Dear Tim,

Here are some suggestions for potential reviewers of a Santer et al. IJoC submission on issues related to the consistency between modeled and observed atmospheric temperature trends. None of the suggested reviewers have been involved in the recent "focus group" that has discussed problems with the Douglass et al. IJoC paper.

1. Mike Wallace, University of Washington. U.S. National Academy member. Expert on atmospheric dynamics. Chair of National Academy of Sciences committee on "Reconciling observations of global temperature change" (2000). Email: wallace@atmos.washington.edu

2. Qiang Fu, University of Washington. Expert on atmospheric radiation, dynamics, radiosonde and satellite data. Published 2004 Nature paper and 2005 GRL paper dealing with issues related to global and tropical temperature trends. Email: qfu@atmos.washington.edu

3. Gabi Hegerl, University of Edinburgh. Expert on detection and attribution of externally-forced climate change. Co-Convening Lead Author of "Understanding and Attributing Climate Change" chapter of IPCC Fourth Assessment Report. Email: Gabi.Hegerl@ed.ac.uk

4. Jim Hurrell, National Center for Atmospheric Research (NCAR). Former Director of Climate and Global Dynamics division at NCAR. Expert on climate modeling, observational data. Published a number of papers on MSU-related issues. Email: jhurrell@cgd.ucar.edu

5. Myles Allen, Oxford University. Expert in Climate Dynamics, detection and attribution, application of statistical methods in climatology. Email: allen@atm.ox.ac.uk

6. Peter Stott, Hadley Centre for Climate Prediction and Research. Expert in climate modeling, detection and attribution. Email:

peter.stott@metoffice.gov.uk

Hi Ben (cc Phil),

just heard back from Glenn. He's prepared to treat it as a new submission rather than a comment on Douglass et al. and he also reiterates that "Needless to say my offer of a quick turn around time etc still stands".

So basically this makes the IJC option more attractive than if it were treated as a comment. But whether IJC is still a less attractive option than GRL is up to you to decide :-) (or feel free to canvas your potential co-authors [the only thing I didn't want to make more generally known was the suggestion that print publication of Douglass et al. might be delayed... all other aspects of this discussion are unrestricted]).

Cheers

Tim

I didn't know about the link between John and Kevin. Sounds like Qiang or Myles, plus Francis, would be best combination of expertise and speediness.

By the way, for online submission you'll just need to convert the Latex to a PDF file and submit that.

Have a good weekend,

Tim

At 17:07 11/01/2008, you wrote:

Dear Phil and Tim,

I did leave Kevin's name off because of concerns that he might be extremely upset by Christy's involvement in Douglass et al. I guess you know that John was a Ph.D. student of Kevin's. It must be tough to have a student who's the antithesis of everything you stand for and care about - careful, thorough science.

Qiang Fu would be great, since he's so knowledgeable about MSU-related issues. I think he would be fast, too. Myles reviewed one of the GRL versions of Douglass et al., so he's very familiar with this territory.

With best regards,

Ben

Phil Jones wrote:

Ben,

I briefly discussed this with Tim a few minutes ago.

With IDAG coming up, it is probably best not to use Gabi and Myles.

I also suggested that Mike Wallace might be slow - as Myles would have been. Peter S might not be right for the IDAG reason and he does work for the HC - where Peter T does.

If Jim is back working he would be good. So would Fu. If Tim can just persuade them to do it - and quickly.

I did suggest Kevin - he would do it quickly - but it may be a read rag to a bull with John Christy on the other paper.

Glad to see you've gone down his route!

Have a good weekend!

Ruth says hello!

Cheers

Phil

Dear Tim,

Here are some suggestions for potential reviewers of a Santer et al. IJoC submission on issues related to the consistency between modeled and observed atmospheric temperature trends. None of the suggested reviewers have been involved in the recent "focus group" that has discussed problems with the Douglass et al. IJoC paper.

1. Mike Wallace, University of Washington. U.S. National Academy member. Expert on atmospheric dynamics. Chair of National Academy of Sciences committee on "Reconciling observations of global temperature change" (2000). Email: wallace@atmos.washington.edu

2. Qiang Fu, University of Washington. Expert on atmospheric radiation, dynamics, radiosonde and satellite data. Published 2004 Nature paper and 2005 GRL paper dealing with issues related to global and tropical temperature trends. Email: qfu@atmos.washington.edu

3. Gabi Hegerl, University of Edinburgh. Expert on detection and attribution of externally-forced climate change. Co-Convening Lead Author of "Understanding and Attributing Climate Change" chapter of IPCC Fourth Assessment Report. Email: Gabi.Hegerl@ed.ac.uk

4. Jim Hurrell, National Center for Atmospheric Research (NCAR). Former Director of Climate and Global Dynamics division at NCAR. Expert on climate modeling, observational data. Published a number of papers on MSU-related issues. Email: jhurrell@cgd.ucar.edu

5. Myles Allen, Oxford University. Expert in Climate Dynamics, detection and attribution, application of statistical methods in climatology. Email: allen@atm.ox.ac.uk

6. Peter Stott, Hadley Centre for Climate Prediction and Research. Expert in climate modeling, detection and attribution. Email: peter.stott@metoffice.gov.uk

Dear folks,

I believe Ben's suggestion is very good compromise and we should prepare a Fig. 4 with three RAOBCORE versions, RICH, HadAT and RATPAC. As I have understood Ben in his first description of Fig. 4, also the range of model trend profiles should be included.

Who will actually draw the figure? I can do this but I do not have the model data and I do not have the RATPAC profiles so far. It would be easiest to remove the Titchner et al. profiles and Steves profiles from Peter's plot. Or should we send our profile data to you, Ben? What do you think?

Concerning the possible reaction of Douglass et al.: RAOBCORE v1.2 and v1.3 are both published in the Haimberger(2007) RAOBCORE paper (where they were labeled differently). Thus they have at least omitted v1.3. RAOBCORE v1.4 time series have published in the May 2007 BAMS climate state of 2006 supplement.

Peter, myself, Dian and probably a few others will meet in Japan by the End of January and a few weeks later in Germany, where we can discuss the latest developments and plan the publishing strategy.

Thanks a lot Ben for moderating this Fig. 4 issue.

Regards,

Leo

Dear Ben and All,

After returning to the office earlier in the week after a couple of weeks off during the holidays, I had the best of intentions of responding to some of the earlier emails. Unfortunately it has taken the better part of the week for me to shovel out my avalanche of email. [This has a lot to do with the remarkable progress that has been made -- kudos to Ben and others who have made this possible]. At this point I'd like to add my 2 cents worth (although with the declining dollar I'm not sure it's worth that much any more) on several issues, some from earlier email and some from the last day or two.

I had given some thought as to where this article might be submitted. Although that issue has been settled (IJC) I'd like to add a few related thoughts regarding the focus of the paper. I think Ben has brokered the best possible deal, an expedited paper in IJC, that is not treated as a comment. But I'm a little confused as to whether our paper will be titled "Comments on ... by Douglass et al." or whether we have a bit more latitude.

While I'm not suggesting anything beyond a short paper, it might be possible to "spin" this in more general terms as a brief update, while at the same time addressing Douglass et al. as part of this. We could begin in the introduction by saying that this general topic has been much studied and debated in the recent past [e.g. NRC (2000), the Science (2005) papers, and CCSP (2006)] but that new developments since these works warrant revisiting the issue. We could consider Douglass et al. as one of several new developments. We could perhaps title the paper something like "Revisiting temperature trends in the atmosphere". The main conclusion will be that, in

stark contrast to Douglass et al., the new evidence from the last couple of years has strengthened the conclusion of CCSP (2006) that there is no meaningful discrepancy between models and observations.

In an earlier email Ben suggested an outline for the paper:

- 1) Point out flaws in the statistical approach used by Douglass et al.
- 2) Show results from significance testing done properly.
- 3) Show a figure with different estimates of radiosonde temperature trends illustrating the structural uncertainty.
- 4) Discuss complementary evidence supporting the finding that the tropical lower troposphere has warmed over the satellite era.

I think this is fine but I'd like to suggest a couple of other items.

First,

some mention could be made regarding the structural uncertainty in satellite

datasets. We could have 3a) for sondes and 3b) for satellite data. The satellite issue could be handled in as briefly as a paragraph, or with a bit more work and discussion a figure or table (with some trends). The main

point to get across is that it's not just UAH vs. RSS (with an implied edge

to UAH because its trends agree better with sondes) it's actually UAH vs all others (RSS, UMD and Zou et al.). There are complications in adding UMD

and Zou et al. to the discussion, but these can be handled either qualitatively or quantitatively. The complication with UMD is that it only

exists for T2, which has stratospheric influences (and UMD does not have a

corresponding measure for T4 which could be used to remove the stratospheric

effects). The complication with Zou et al. is that the data begin in 1987,

rather than 1979 (as for the other satellite products).

It would be possible to use the Fu method to remove the stratospheric influences from UMD using T4 measures from either or both UAH and RSS. It would be possible to directly compare trends from Zou et al. with UAH, RSS

& UMD for a time period starting in 1987. So, in theory we could include some trend estimates from all 4 satellite datasets in apples vs. apples comparisons. But perhaps this is more work than is warranted for this project.

Then at very least we can mention that in apples vs. apples comparisons made

in CCSP (2006) UMD showed more tropospheric warming than both UAH and RSS, and in comparisons made by Zou et al. their dataset showed more warming than both UAH and RSS. Taken together this evidence leaves UAH as the "outlier" compared to the other 3 datasets. Furthermore, better trend agreement between UAH and some sonde data is not necessarily "good" since the sonde data in question are likely to be afflicted with considerable spurious cooling biases.

The second item that I'd suggest be added to Ben's earlier outline (perhaps as item 5) is a discussion of the issues that Susan raised in earlier emails. The main point is that there is now some evidence that inadequacies in the AR4 model formulations pertaining to the treatment of stratospheric ozone may contribute to spurious cooling trends in the troposphere.

Regarding Ben's Fig. 1 -- this is a very nice graphical presentation of the differences in methodology between the current work and Douglass et al. However, I would suggest a cautionary statement to the effect that while error bars are useful for illustrative purposes, the use of overlapping error bars is not advocated for testing statistical significance between two variables following Lanzante (2005).

Lanzante, J. R., 2005: A cautionary note on the use of error bars. *Journal of Climate*, 18(17), 3699-3703.

This is also motivation for application of the two-sample test that Ben has implemented.

Ben wrote:

> So why is there a small positive bias in the empirically-determined
> rejection rates? Karl believes that the answer may be partly linked to
> the skewness of the empirically-determined rejection rate
distributions.

[NB: this is in regard to Ben's Fig. 3 which shows that the rejection rate in simulations using synthetic data appears to be slightly positively biased compared to the nominal (expected) rate].

I would note that the distribution of rejection rates is like the distribution of precipitation in that it is bounded by zero. A quick-and-dirty way to explore this possibility using a "trick" used with precipitation data is to

apply a square root transformation to the rejection rates, average these, then reverse transform the average. The square root transformation should yield data that is more nearly Gaussian than the untransformed data.

Ben wrote:

> Figure 3: As Mike suggested, I've removed the legend from the interior of the Figure (it's now below the Figure), and have added arrows to indicate the theoretically-expected rejection rates for 5%, 10%, and 20% tests. As Dian suggested, I've changed the colors and thicknesses of the lines indicating results for the "paired trends". Visually, attention is now drawn to the results we think are most reasonable - the results for the paired trend tests with standard errors adjusted for temporal autocorrelation effects.

I actually liked the earlier version of Fig. 3 better in some regards. The labeling is now rather busy. How about going back to dotted, thin and thick curves to designate 5%, 10%, and 20%, and also placing labels (5%/10%/20%) on or near each curve? Then using just three colors to differentiate between Douglass, paired/no_SE_adj, and paired/with_SE_adj it will only be necessary to have 3 legends: one for each of the three colors.

This would eliminate most of the legends.

Another topic of recent discussion is what radiosonde datasets to include in the trend figure. My own personal preference would be to have all available datasets shown in the figure. However, I would defer to the individual dataset creators if they feel uncomfortable about including sets that are not yet published.

Peter also raised the point about trends being derived differently for different datasets. To the extent possible it would be desirable to have things done the same for all datasets. This is especially true for using the same time period and the same method to perform the regression. Another issue is the conversion of station data to area-averaged data. It's usually easier to insure consistency if one person computes the trends from the raw data using the same procedures rather than having several people provide the trend estimates.

Karl Taylor wrote:

> Ben and I have already discussed this point, and I think we're both
> still a bit unsure on what's the best thing to do here. Perhaps others
> can provide convincing arguments for keeping the figure as is or making
> it symmetric as I suggest.

I agree with Karl in regard to both his concern for misinterpretation as well as his suggested solution. In the limit as N goes to infinity we expect the distribution to be symmetric since we're comparing the model data

with itself. The problem we are encountering is due to finite sample effects.

For simplicity Ben used a limited number of unique combinations -- using full bootstrapping the problem should go away. Karl's suggestion seems like a simple and effective way around the problem.

Karl Taylor wrote:

> It would appear that if we believe FGOALS or MIROC, then the
> differences between many of the model runs and obs are not likely to be
> due to chance alone, but indicate a real discrepancy ... This would seem
> to indicate that our conclusion depends on which model ensembles we have
> most confidence in.

Given the tiny sample sizes, I'm not sure one can make any meaningful statements regarding differences between models, particularly with regard to

some measure of variability such as is implied by the width of a distribution.

This raises another issue regarding Fig. 2 -- why show the results separately

for each model? This does not seem to be relevant to this project. Our objective is to show that the models as a collection are not inconsistent with the observations -- not that any particular model is more or less consistent with the observations. Furthermore showing results for different

models tempts the reader to make such comparisons. Why not just aggregate the

results over all models and produce a histogram? This would also simplify the figure.

Best regards,

____John

Hi Phil

I'll read it more thoroughly later. My quick impression, more from the abstract than the main text, is that you are defensive and it almost seems that there is a denial of the UHI in part. Yet later in the abstract and nicely in the first two sentences of the conclusions, you recognize that the UHI is real and the climate is different in cities. The point is that the homogenization takes care of this wrt the larger scale record and that UHI is essentially constant at many sites so that it does not alter trends. So I urge you to redo the abstract and be especially careful of the wording.

You might even start with:

The Urban Heat Island (UHI) is a real phenomenon in urban settings that generally makes cities warmer than surrounding rural areas. However, UHIs are evident at both London and Vienna, but do not contribute to the warming trends over the 20th century because the city influences have not changed much over that time. Similarly, ...

Regards

Kevin

Phil Jones wrote:

Dear All,

I have mentioned to you all that I've been working on a paper on Chinese temperature trends. This partly started because of allegations about Jones et al. (1990). This shows, as expected, that these claims were groundless.

Anyway - I'd appreciate if you could have a look at this draft. I have spelt things out in some detail at times, but I'm expecting if it is published that it will get widely read and all the words dissected. I know you're all very busy and I could have been doing something more useful, but it hasn't taken too long.

The European examples are just a simple way to illustrate the difference between UHIs and urban-related warming trends, and an excuse to reference Luke Howard.

Cheers

Phil

Jim, Gavin,

Thanks for the summary about 2007. We're saying much the same things about recent temps, and probably when it comes to those idiots saying global warming is stopping - in some recent RC and CA threads. Gavin has gone to town on this with 6,7, 8 year trends etc.

What I wanted to touch base on is the issue in this figure I got yesterday. This is more of the same. You both attribute the differences to your extrapolation over the Arctic (as does Stefan). I've gone along with this, but have you produced an NH series excluding the Arctic ? Do these agree better?

I reviewed a paper from NCDC (Tom Smith et al) about issues with recent SSTs and the greater number of buoy type data since the late-90s (now about 70%) cf ships. The paper shows ships are very slightly warmer cf buoys (~0.1-0.2 for all SST). I don't think they have implemented an adjustment for this yet, but if done it would raise global T by about 0.1 for the recent few years. The paper should be out in J. Climate soon.

The HC folks are not including SST data appearing in the Arctic for regions where their climatology (61-90) includes years which had some sea ice. I take it you and NCDC are not including Arctic SST data where the climatology isn't correct? You get big positive anomalies if you do.

Some day we will have to solve both these issues. Both are difficult, especially the latter!

Cheers

Phil

Kevin,

Homogeneity only done on mean T. Lots of sites just measure this. A lot will measure max and min, but I haven't got the data. I also didn't want to get into max/min as what is relevant to urban-related warming in the global land series (or China) is the effects on mean T. I can't then look at max or min against a rural series.

I would expect max to have changed less than min, but I can't really look at that.

Also I don't want to confuse readers by saying there is an urban-related temp influence, but it is to a lower DTR. I guess I could refer to Vose et al (our Fig 3.11) which does show a decrease in DTR for 79-04 over China (mostly blues).

I'll work on the text.

Cheers

Phil

At 04:50 15/01/2008, Kevin Trenberth wrote:

I looked at the paper in more detail. It obviously needs a bit of polishing throughout.

I have a couple of fairly major comments. The first is that you only deal with the mean temperature and nothing on the max and min temperatures. Are those available? It would be much more powerful if those could be included. The second is the special situation in China associated with urbanization and that is air pollution. You do not mention aerosols and their effects. We have some on that in AR4 that may be of value: refer to our chapter.

In China, there has been so much increase in coal fired power and pollution (11 out of the top worst ten polluted cities in the world are in China, or something like that). So you do not see the sun for long periods of time. Presumably that greatly cuts down on the max temp but may also increase the min through a sort of greenhouse effect? Effects of urban runoff tend to warm and space heating also warms but should mainly affect the min. Pollution may not be in the inner city but concentrated more near the sites of industry and power stations; but also may not be that local owing to winds? Pollution may also change fog or smog conditions, and may also change drizzle and precip. Looking at other variables could help with whether the changes are local or linked to atmospheric circulation.

The unique aspect of urbanization related to air pollution should make China different, but may not be easily untangled without max and min temps (and DTR).

Anyway, given these aspects, you may want to at least assemble the expectations somewhere altogether and discuss max (day) vs night (min) effects?

Hope this helps

Kevin

Mike,

Good triumphs over bad - eventually!

It does take a long time though!

Maybe Ray P. wants to do something. He is more up to speed
on all this - and reads French!

Cheers

Phil

At 14:33 15/01/2008, Michael Mann wrote:

Phil,

thanks for sending on, I've sent to Ray P. The Passoti piece is remarkably bad for a Science "news" piece, it would be worth discussing this w/ the editor, Donald Kennedy who is quite reasonable, and probably a bit embarrassed by this.

My french isn't great, but I could see there was something also about the Moberg reconstructions, Courtillot obviously trying to use that to arge that the recent warming isn't anomalous (even though the Moberg recon actually supports that it is).

I'll need to read over all of this and try to digest when I have a chance later today.

Keep up the good fight, the attacks are getting more and more desparate as the contrarians are increasingly losing the battle (both scientifically, and in the public sphere). one thing I've learned is that the best way to deal w/ these attacks is just to go on doing good science, something I learned from Ben...

talk to you later,

mike

Well, the Phil Jones wrote:

Gavin, Mike,

Some emails within this and an attachment. Send on to Ray Pierrehumbert.

Maybe you're aware but things in France are getting bad.

One thing might be a letter to Science re the diagram in an editorial in Science.

I did talk to the idiot who wrote this, but couldn't persuade him it was rubbish. This isn't the worst - see this email below from Jean Jouzel and Edouard Bard. My French is poor

at the best of times, but this all seems unfair pressure on Edouard.

See also this in French about me - lucky I can't follow it that well !

I know all this is a storm in a teacup - and I hope I'd show your resilience Mike if this was directed at me. I'm just happy I'm in the UK, and our Royal Society knows

who and why it appoints its fellows!

In the Science piece, the two Courtillot papers are rejected. I have the journal rejection emails - the other reviewer wasn't quite as strong as mine, but they were awful.

Cheers

Phil

Dear Phil,

Yes the situation is very bad in and I was indeed going to write you to ask somewhat for your help in getting some support to Edouard, which is really needed. Certainly one thing you could do would be to write to the editor of Science at least pointing to the fact that the figure is misleading using again the seasonal above 20°N Briffa et al. data set as global.

May be also at some point write something supporting the answer of Edouard and Gilles Delage, to EPSL (or in answering the letter Courtillot has recently written see attached in which he is very critical with respect to your work). I don't know

Yes I will be in Vienna , this will be a pleasure to meet you With my best Jean

At 15:29 +0000 14/01/08, Phil Jones wrote:

Jean,

Will you be going to the EGU in Vienna this April?

This disagreement with Courtillot seems to be getting out of hand.

Edouard isn't having a great time at the moment.

The data Courtillot used is not on the CRU web site. We did produce it, but for a paper Keith worked on in 2002. Courtillot's global is CRU data, but not the globe - it is land north of 20N and April to September only!

The French Academy is looking a bit of a laughing stock! I did meet Courtillot in March last year - he was courteous, but he should read the literature!

Cheers

>Courtilot says he will soon publish two studies arguing that methods used to measure global T need to be revised. Wonder if these are the two that I rejected!

Maybe one day he'll realise that there is oceanic data!

Cheers

Phil

Hello Phil,

These are indeed the papers submitted to EPSL. Courtilot has control on other journals and I'm sure he will manage to publish them somewhere else ...

As you can read below, Courtilot accused me publicly of scientific misconduct in a written message sent in copy to the president of the Academy of Science, to the president of the CNRS and to the Director of the Cabinet of the Ministry of Higher Education and Research. According to Courtilot, my misconduct is that I have acted as a hacker, introducing a "note added in proof" in my EPSL paper without the editor and the publisher even knowing it !

Courtilot even requested the organization this week of a secret meeting at the Academy in order to expose the case (yes, you've read it correctly, this is officially called "un comité secret"). I am not a member of the Academy and nobody is there to defend my case. Hence, I was obliged to write this long email to explain my position to some academicians.

I'm not really planning for sending soon something to Science as my next week will be hectic with this "inquisition" committee against me and the impact of the "droit de réponse" in newspaper(s). I am sure that Courtilot will even use Pasotti's poor paper against me during the audit of the case at the Academy. As I am the main author for the Comment, sending a rebuttal to Science may even be counterproductive. Do you plan to send something to Science about the fact that the Figure misrepresent Tglobe ?

I'm quite depressed because this is taking a lot of my time and energy. Everybody at home is mad at me, children and wife, because I spend hours and days in the lab writing and checking emails and answering phone calls.

Best wishes, Edouard

Subject: Accusations de M. Courtilot

Destinataires:

Madame la Présidente du CNRS, Monsieur le Président de l'Académie des Sciences, Monsieur le Directeur de Cabinet de Madame la Ministre de l'Enseignement Supérieur et de la Recherche,

Mesdames et Messieurs, Membres de l'Académie (incluant M. Courtillot).

Chers Collègues,

Je reviens à l'instant d'une tournée de conférences en Angleterre (Royal Geographical Society de Londres et Université de Cambridge). J'apprends avec stupeur que Monsieur Courtillot m'attaque personnellement et publiquement d'avoir eu un comportement contraire à l'éthique scientifique ("contrairement aux règles déontologiques, la note de M. Bard a été envoyée APRES acceptation de son commentaire critique", cf. plus bas le message envoyé hier le 11 janvier et dont vous êtes destinataires). Cette accusation surprenante est totalement infondée.

Je rappelle que dans mon Commentaire qui vient d'être publié par la revue Earth & Planetary Science Letters (EPSL, pdf attaché), je n'ai proféré aucune accusation à l'égard de M. Courtillot. J'évite justement d'avoir un ton polémique en me cantonnant à des discussions dans l'arène scientifique, par exemple mes interventions lors du colloque organisé par M. Courtillot à l'Académie des Sciences (conférence et débat disponibles sur le site internet de l'Académie:

[7]http://www.academie-sciences.fr/conferences/seances_publicques/html/debat_13_03_07.htm

[8]<http://www.canalacademie.com/Modelisation-du-climat-et-role-du.html>

ou mes publications, notamment ce 'Commentaire' Bard & Delaygue (2008 EPSL). Sur cette affaire, je n'ai accepté de faire aucun commentaire dans la presse et j'ai refusé toutes les demandes d'interview par les media audiovisuels. Même si je ne le voulais pas, je suis maintenant forcé de sortir de ma réserve et de me défendre publiquement contre les accusations de M. Courtillot.

La "note added in proof" dont vous parle M. Courtillot a été soumise normalement pour approbation au rédacteur d'EPSL (editor en anglais), M. Rob van de Hilst du MIT, comme le demande classiquement l'éditeur Elsevier (publisher) lorsqu'il envoie les épreuves d'un article à son auteur. Vous trouverez ci-dessous la copie de mon dernier échange à ce sujet avec M. van der Hilst qui explique clairement que je n'ai absolument rien à me reprocher. M. van der Hilst écrit lui-même "INDEED, YOU DID THE RIGHT THING IN ASKING MY APPROVAL.". Le fait que ma "note added in proof" ait été incluse dans la version sous presse de notre Commentaire est simplement dû à une erreur technique de l'éditeur Elsevier. Il est évidemment IMPOSSIBLE pour un auteur de modifier lui-même quoi que ce soit sur le site web d'Elsevier !

La meilleure preuve que cette fameuse note a été CRUCIALE pour clarifier l'origine des données utilisées par M. Courtillot est que justement le rédacteur, M. van der Hilst, a finalement décidé de la publier in extenso pour expliquer aux lecteurs son importance (sa note éditoriale complète est copiée plus bas). M. van der Hilst écrit ainsi "Bard and Delaygue noticed inconsistencies in the citation of data sources in Courtillot et al. (2008). and Courtillot et al. (2007)..." "instead of global, annual means they are seasonal estimates from land regions north of 20°N. With access to the correct data

files readers can form their own opinion on the analysis of and conclusions by Courtillot et al. (2007)."

Il aura donc fallu une année (voire plus, depuis Le Mouël et al. 2005 EPSL) et de nombreux courriers et publications, pour que l'on sache enfin quelles sont les températures représentées par Courtillot et al. (2007) et Le Mouël et al. (2005). La réalité est que la courbe de température utilisée par Courtillot & Le Mouël provient d'un calcul de moyenne régionale et saisonnière (Briffa et al. JGR 2001) fondé sur les séries de températures de Jones et al. (1999 Rev. Geophys.). Le fichier cité par Courtillot et al. (2007) n'est donc pas un de ceux distribués par M. Philip D. Jones (University of East Anglia & Hadley Center), ni même tiré directement de l'article de Jones et al. (1999). La citation correcte aurait dû être l'article de Briffa et al. (2001) dont Jones est coauteur. Ceci étant dit, le problème CRUCIAL est qu'il ne s'agit pas de moyenne annuelle mondiale (Tglobe) comme l'ont écrit Courtillot et al. (2007) et Le Mouël et al. (2005), mais en fait de données régionales ET saisonnières (latitudes >20°N ET seulement sur les continents ET seulement pendant la saison chaude d'Avril à Septembre). Les courbes de la température moyenne annuelle mondiale (de MM. Phil Jones d'UEA ou de Jim Hansen de la NASA) ne présentent pas de corrélation marquée avec l'éclairement solaire et les indices géomagnétiques, en particulier au niveau des années 70 (voir la Figure 1 de notre Commentaire publié par EPSL qui représente la VERITABLE courbe de température globale distribuée par M. Phil Jones).

Pour ce qui concerne les données d'irradiance solaire totale, les lecteurs d'EPSL sont maintenant pleinement informés du fait que les données utilisées par Courtillot et al. (2007) et Le Mouël et al. (2005) NE sont PAS des données d'irradiance totale (Solanki 2002), mais seulement de la petite composante ultraviolette (Tobiska 2001).

Dans leur Réponse publiée par EPSL, M. Courtillot et ses collègues accompagnent la nouvelle citation d'une note très surprenante (page 2, colonne 1): "(Tobiska, 2001; note that in Le Mouël et al., (2005), this data set was erroneously attributed to Solanki, 2002, although resulting changes are negligible)". Dans leurs deux articles Le Mouël et al. (2005) et Courtillot et al. (2007) auraient donc fait la même erreur de citation (Solanki 2002 au lieu de Tobiska 2001). Le problème est que justement les changements qui en résultent NE sont PAS du tout négligeables. Si Courtillot et al. (2007) et Le Mouël et al. (2005) avaient effectivement utilisé Solanki (2002), ils auraient inévitablement représenté la courbe d'irradiance S(t) sur tout le 20e siècle car leur figure est focalisée sur tout ce siècle et que l'analyse de Solanki (2002) porte précisément sur TOUT le 20e siècle. Pour que l'utilisation de la courbe de Solanki n'entraîne que des changements négligeables, comme ils l'écrivent, il faudrait que ces auteurs tronquent délibérément la courbe de Solanki pour n'en montrer que la moitié (les derniers 50 ans). C'est une accusation grave que je ne fais bien évidemment pas. Par conséquent, l'utilisation de la courbe de Solanki (2002) devant être faite pour tout le 20e siècle, ceci entraîne des changements importants comme les lecteurs de notre Commentaire peuvent le constater (voir la Figure 1 qui représente la VERITABLE courbe d'irradiance solaire totale distribuée par M. S. Solanki pour TOUT le 20e siècle). En particulier, il apparaît clairement que les deux courbes géomagnétiques ESK et SIT proposées par Courtillot et al. (2007) et Le Mouël et al. (2005) sont en DESACCORD

FLAGRANT vers les années 70 avec les VERITABLES courbes de la température moyenne annuelle mondiale et de l'irradiance solaire totale (dans notre Commentaire, nous soulignons au passage que l'index géomagnétique AA est en bien meilleur accord, fait connu et publié depuis dix ans, e.g. Cliver et al. 1998 GRL).

Monsieur Courtillot n'apporte aucune réponse à ces nombreux problèmes. Par ailleurs, il est navrant de constater que dans ses conférences publiques récentes (voir celle donnée lors du 125e anniversaire de l'ESPCI avec fichier powerpoint disponible sur le site web [9]<http://www.espci.fr/actu/espci125/pgm0011.htm>), M. Courtillot continue encore de montrer le même diagramme erroné, avec une courbe de température "Tglobe" qui n'est pas une courbe de moyenne annuelle mondiale de la température et une courbe "S(t)" qui n'est pas une courbe d'irradiance solaire totale. De plus, M. Courtillot montre encore cette courbe sur 50 ans seulement, alors même qu'il a pleinement connaissance de travaux qui donnent l'irradiance sur le tout le 20e siècle (Solanki 2002, article qu'il a lui-même cité depuis 2005).

Je vous prie de croire, Chers Collègues, à l'assurance de mes sentiments respectueux et dévoués.

Objet : Droit de réponse

Importance : Haute

Madame,

étant donné le contenu du message que j'ai reçu de vous hier, je préfère continuer notre échange en en gardant des traces écrites et en le communiquant à des tiers en tant que de

besoin, en cas de suites juridiques.

Un résumé sans doute un peu simplifié mais me semble t'il non faux de notre dernière conversation et de votre message sur ma boîte vocale est le suivant.

"Votre journaliste ne m'a pas calomnié; il a simplement retranscrit des accusations formulées dans une publication scientifique. En revanche, ma réponse vous poserait des problèmes juridiques et vous auriez des amendements à m'y faire apporter."

Je vous demande tout simplement de me renvoyer mon texte avec les modifications qui vous paraissent nécessaires en rouge, naturellement maintenues à leur minimum, puisqu'il s'agit d'une lettre que j'écris et dont j'endosse la responsabilité, avec toute la force que me donne l'évident droit de réponse (pas un lecteur que j'ai rencontré ne l'a nié, quelque soir par ailleurs la réalité du fond) que vous me devez et que Gérard Courtois a reconnu a plusieurs reprises depuis le 21 décembre dernier (tout cela traîne de façon étonnante...).

En ce qui concerne vos échanges avec M. Foucart tels que vous me les rapportez dans le message vocal (que j'ai conservé), juste deux commentaires:

1) vous me dites que le fond du débat entre nous deux est scientifique. M. Foucart est un journaliste pas un scientifique (ce sont deux métiers différents, a priori également estimables). Seuls les propos qu'il peut valablement citer avec leurs sources provenant de scientifiques qui en portent alors la responsabilité sont des débats scientifiques.

2) Vous me dites que M. Foucart a tout fait pour me joindre. Il est exact (je l'ai vérifié) qu'il a téléphoné à M. Dyon à l'IPGP, une demi-heure après que je sois rentré chez moi victime d'une grippe qui m'a tenu au lit trois jours avec 38°5. Une fois guéri, je suis passé à la garde de mes enfants et petits enfants qui étaient balayés par le virus. Rien de grave et nombreux sont ceux qui y sont passés à Noël. Donc j'étais réellement souffrant (et pas entre guillemets) ce soir là. Mais je n'ai fait barrage à aucune demande qui m'aurait été faite: mon numéro de téléphone est public, dans les pages planches du bottin, pas sur liste rouge, il était facile de m'appeler chez moi. Je n'ai reçu aucun coup de téléphone de M. Foucart, ni d'ailleurs d'aucun des autres journalistes. Et faire son travail en l'occurrence, alors que rien ne justifiait l'urgence de la publication de ce sujet, c'était attendre un ou deux jours et faire l'effort de me téléphoner et d'avoir mon témoignage. L'effort fait s'est limité à ce coup de fil à l'IPGP...

J'ai eu la possibilité de démontrer hier pendant deux heures devant un auditoire scientifique de plus de 150 personnes que non seulement les accusations portées contre nous, notamment par votre journaliste, étaient purement et simplement sans fondement, mais que de plus les critiques scientifiques formulées par Edouard Bard et Gilles Delaygue étaient pour l'essentiel fausses ou fondées sur des témoignages faux que leur avaient fourni certains de leurs collègues. Nos conclusions scientifiques restent donc dans leur totalité. mais ceci est la partie scientifique et ce qui m'intéresse en ce qui vous concerne c'est de faire savoir à vos lecteurs que les allégations de M. Foucart dans l'article incriminé étaient fausses, et j'ai le droit de le faire et rapidement et sans censure!

Dans ce séminaire hier, étaient présentes de très nombreuses personnes qui pourront porter témoignage. C'est le cas de l'ancienne directrice de la recherche, Mme Giacobino,

de la présidente du CNRS Madame Catherine Bréchnignac qui m'a publiquement assuré de son soutien et m'a assuré qu'elle était totalement convaincue par ma démonstration (sa compétence scientifique ne devrait pas être trop inférieure à celle de M. Foucart). Etaient également présents un journaliste de l'AFP et un journaliste de Science et Avenir. Cette conférence, comme toutes celles de l'IPGP, sera bientôt disponible sur cd et intranet.

Mardi prochain, je suis invité par le président de l'académie des sciences à exposer pendant 20mn l'ensemble de nos arguments. Je pense que le résultat sera le même qu'hier à l'IPGP. A cette occasion, puisqu'aucune n'est encore sortie, je remettrai à l'ensemble des académiciens une copie des trois lettres de droit de réponse envoyées aux journaux, dont le vôtre. J'aurais préféré qu'elles soient publiées avant cette date (je note que ni Libération ni le Figaro ne m'ont à ce jour donné la moindre indication sur la publication de mes droits de réponse; le Monde aura pour l'instant été le plus réactif. Je mets en copie les trois personnes à qui j'ai originellement envoyé mon droit de réponse dans ces trois journaux).

J'attends donc la version amendée que vous souhaitez me voir accepter.

Sincèrement, VC

PS J'ai eu copie, comme M. Foucart l'évoquait, d'une réponse qu'il a fournie à un de mes amis qui lui avait écrit; je la reproduis ci dessous. Je ne souhaite y relever qu'une seule phrase: "Le blog RealClimate cité dans l'article n'est que la façade d'une polémique qui se joue dans une revue savante, EPSL en l'occurrence. " Cette présentation est inexacte. L'échange dans EPSL est un échange scientifique, sans polémique et surtout sans diffamation. Il est cependant désormais établi que, contrairement aux règles déontologiques, la note de M. Bard a été envoyée APRES acceptation de son commentaire critique. Le rédacteur de la revue vient de nous envoyer copie de l'éditorial qu'il va faire publier en en-tête de nos deux articles dès la publication papier (qui fait autorité et doit avoir lieu très prochainement). Je vous joins également copie de cet éditorial. La ligne jaune est celle qui sépare le débat scientifique de la diffamation. La diffamation n'apparaît pas dans EPSL mais dans le blog Real Climate et elle est reprise activement, sous leur signature et non pas seulement en citation entre guillemets) par les journalistes. Là est la faute juridiquement répréhensible qu'ils ont commise. Là est la base de mon droit de réponse. La journaliste neutre et semblable au lecteur de base du Monde que vous m'avez dit être doit facilement s'en convaincre si elle est impartiale.

Subject: Re: ESPL comment & reply

Dear Edouard, a very quick response - I cannot do anything until I hear from Elsevier's production office that changes can or cannot be made. But I want to avoid

misunderstandings between us. I do not ACCUSE you of adding material and hide it from me - indeed, you did the right thing in asking my approval. However, if you now go on line and check your "comment" you will see that it does have the 'note added in proof'. So by returning the proofs with the addition it did make it to the public domain REGARDLESS of me approving it or not. The EPSL production staff should have picked up on this. So I am not pointing fingers here - I just have to deal with an unfortunate situation in which a significant addition to an already accepted text may make it into the literature even if the other party has no chance to repond or clarify the issue.
OK? Cheers, Rob

To: Rob van der Hilst [28]<hilst@MIT.EDU>
From: Edouard BARD [29]<bard@cerege.fr>
Subject: ESPL comment & reply
Dear Rob,

>In principle, after approval of a 'comment' the other party is given the opportunity to respond, and approval of the 'reply' closes the process. To avoid going-back-and-forth, in my view the material should not appear on line until after approval of the corrected proofs.

I agree.

>In this case you added material to the 'comment' after seeing the 'reply', and without my consent.

I disagree with your accusation. I did NOT try to add anything and hide it from you. Indeed, I immediately sent an email to you in order to propose our 'note added in proof'. I did this because I knew very well that such a note could not be published without your consent (during 4 years I also served EPSL). Indeed, the Elsevier message accompanying the uncorrected proofs is very clear on this issue "Significant changes to the article as accepted for publication will only be considered at this stage with permission from the Editor." This was exactly the purpose of my email to you.

>In my view the sole purpose of your addition is - or, at least, should be -
> to help clarify an important issue for the readers.

This is precisely my goal.

>(NB I am sure you realize that your 'note added in proof' could be perceived by readers as an accusation that Courtillot et al are not honest about the source of the data, in particulare related to the Tglobe file, and that would be quite a serious matter.)

I am open for revision of the note if you think it could be misinterpreted. Whatever the reason for the discrepancy, it is important that the reader can identify exactly the source of these important data (published paper or valid URL). This is clearly a problem with many source of data cited by Courtillot et al (and Le Mouel et al.). For example the (flawed) TSI SOLAR2000 curve now cited in the Reply by Courtillot et al. should be accompanied by its URL and/or its reference (Tobiska 2001). It is even worse for the Tglobe curve which source is still completely unclear: it does not correspond to the cited reference and the code file cited in the Reply is not available. As previously stated, it is even possible to see that it does not correspond to the cited Tglobe curve just by looking at their shapes (see Fig. 1 of our Comment that provides the two very similar Tglobe curves developed at UEA by the group of Phil Jones and at NASA by the group of Jim Hansen). If you compare these two Tglobe curves with the one represented on Fig. 3 of Courtillot et al. (2007), you will immediately see that there are important differences in the shape of the maximum in the 40s, the pause (or minimum) in the 60-70s and the phase lag in the 30s. Comparison with the Tglobe curve is obviously central to all climate-related discussions in these papers.

Best regards,
Edouard

Editorial Note

The paper entitled "Are there connections between the Earth's magnetic field and climate?" published in Earth and Planetary Science Letters (Courtillot et al., 2007) triggered a "comment" (Bard and Delaygue, 2008) and a "reply" (Courtillot et al, 2008). These publications, and EPSL's handling of the "comment" and "reply" (hereinafter C08), have received significant attention in electronic and printed news media.

In a "comment-reply" exchange, standard editorial policy gives the responder the last word and requires that the "comment" is not changed once accepted by the Editor and replied to by the authors whose work is being criticized. In this case, Bard and Delaygue noticed inconsistencies in the citation of data sources in C08 and Courtillot et al. (2007) after the (accepted) "comment" and "reply" had appeared online (but before they received galley proofs). They pointed this out in a "Note added in Proof" to their "comment". Being against EPSL's policy this modification was disapproved (and removed). However, properly reporting data is an essential aspect of scientific communication in that it enables independent evaluations of the analysis presented by authors. Therefore, Courtillot et al. were asked to clarify (in C08) the source of the data used.

For full disclosure, the note by Bard and Delaygue is reproduced here:

"In their Response to our Comment, Courtillot et al. state that for the total irradiance curve $S(t)$ they had used the SOLAR2000 model product by Tobiska (2001) instead of the century-long record by Solanki (2002) cited in their original paper (Courtillot et al. 2007). However, the SOLAR2000 model is restricted to the UV component and their total solar irradiance is severely flawed as pointed out by Lean (2002). For the global

temperature Tglobe curve cited from Jones et al. (1999) in Courtillot et al. (2007), these authors now state in their response that they had used the following data file: monthly_land_and_ocean_90S_90N_df_1901-2001mean_dat.txt. We were unable to find this file even by contacting its putative author who specifically stated to us that it is not one of his files (Dr. Philip D. Jones, written communication dated Oct. 23, 2007)." In response, Courtillot et al. (2007) provided two modifications (in italics) in C08: "The solar irradiance daily time series we used is that from the SOLAR2000 research grade model upgraded to v1.23A (file Five_cycle_v1_23a.txt dated 23 April 2003) which covers the time period from 14 February 1947 to 31 May 2002 (Tobiska, 2001; note that in Le Mouél et al, 2005, this data set was erroneously attributed to Solanki, 2002, although resulting changes are negligible)." and "The temperature series we actually used is obtained from Briffa et al. (2001) - specifically, column 7 of [30]ftp://ftp.ncdc.noaa.gov/pub/data/paleo/treering/reconstructions/n_hem_temp/briffa2001jgr3.txt, that is, years 1871 to 1997 - which is, originally, from Jones et al (1999) as quoted. All we did was to average it over an 11yr sliding window."

The ftp link shows that the temperatures used are indeed from Jones and co-workers, but instead of global, annual means they are seasonal estimates from land regions north of 20°N. With access to the correct data files readers can form their own opinion on the analysis of and conclusions by Courtillot et al. (2007).

Ray,

Glad to see you're onto this. Obviously anything shouldn't make it even worse for Edouard, but you're in contact with him.

I'd be happy to sign onto any letter from Science, but this isn't essential. I know the series Courtillot has used (and Pasotti re-uses) came from here, but it isn't what he and the authors says it was. I also know it doesn't make much difference if the correct one was used - given the smoothing. It is just sloppy and a principle thing. The correct data are sitting on our web site and have been since Brohan et al (2006) appeared in JGR. Even the earlier version (HadCRUT2v) would have been OK, but not a specially produced series for a tree-ring reconstruction paper back in 2001/2 and not on our web site.

Then there are all the science issues you and Edouard have raised in RC and the EPSL comment.

I have had a couple of exchanges with Courtillot. This is the last of them from March 26, 2007. I sent him a number of papers to read. He seems incapable of grasping the concept of spatial degrees of freedom, and how this number can change according to timescale. I also told him where he can get station data at NCDC and GISS (as I took a decision ages ago not to release our station data, mainly because of McIntyre). I told him all this as well when we met at a meeting of the French Academy in early March.

What he understands below is my refusal to write a paper for the proceedings of the French Academy for the meeting in early March. He only mentioned this requirement afterwards and I said I didn't have the time to rewrite was already in the literature. It took me several more months of emails to get my expenses for going to Paris!

Cheers

Phil

From Courtillot 26 March 2007

Dear Phil,

Sure I understand. Now research wise I would like us to remain in contact. Unfortunately, I have too little time to devote to what is in principle not in my main stream of research and has no special funding. But still I intend to try and persist. I find these temperature and pressure series fascinating. I have two queries:

1) how easy is it for me (not a very agile person computer wise) to obtain the files of data you use in the various global or non global averages of T (I mean the actual montly data in each 5° box prior to any processing, including computation of the "temperature anomaly")? How do I do it? What I would like to be able to extract is for instance all of

the data within a given 5° by 5° box with their dates (so: lat, lon, time, value). I understand these are monthly means, though we find that there may be some quite important information in the daily values which is likely lost on monthly averaging, but this is another question...

2) I know you answered my question but still I have trouble grasping the answer. Could you explain how the global T average for periods say before 1900 can have a total uncertainty under 0.2°C back to 1850. This can only be true, given the data distribution in the Rayner et al paper, if T is an incredibly smooth function of location. Did you really answer me that by extracting from the recent (post 1950) database data with the same geographical and temporal distributions as the 1850-1900 data you get almost the same result as with the full modern data (with an uncertainty just above 0.1°C). This seems truly amazing, and would never work with the global magnetic field data I am accustomed to work on. Yet it does not seem to me that climate varies as slowly and with as long spatial scales as the magnetic field...

I will very much appreciate your comments and help on those.

Thank you again for having come to our meeting.

Yours very sincerely,

Vincent

Yes indeed. I am writing a letter to Science today regarding Pasotti's ridiculous article. If anybody things the rest of RC should sign on to that as well, just let me know.

I will also have to write a Part III, covering all the junk mentioned by Edouard and by Phil Jones. Courtillot's response (published via a legal device activated where there is the possibility of threatening a libel suit) appeared in Le Monde today. I may give it a week or so for new developments to settle down before writing.

For example, Foucart may get a chance to write a response in Le Monde.

While I'll wait a bit before doing the RC piece, I plan to send off the letter to Science this week.

Some emails within this and an attachment. Send on to Ray Pierrehumbert.

Maybe you're aware but things in France are getting bad.

One thing might be a letter to Science re the diagram in an editorial in Science. I did talk to the idiot who wrote this, but couldn't persuade him it was rubbish. This isn't the worst - see this email below from Jean Jouzel and Edouard Bard. My French is poor

at the best of times, but this all seems unfair pressure on Edouard.

See also this in French about me - lucky I can't follow it that well !

I know all this is a storm in a teacup - and I hope I'd show your resilience Mike if this was directed at me. I'm just happy I'm in the UK, and our Royal Society knows who and why it appoints its fellows!

In the Science piece, the two Courtillot papers are rejected. I have the journal rejection emails - the other reviewer wasn't quite as strong as mine, but they were awful.

Cheers

Phil

Dear Phil,

Yes the situation is very bad in and I was indeed going to write you to ask somewhat for your help in getting some support to Edouard, which is really needed. Certainly one thing you could do would be to write to the editor of Science at least pointing to the fact that the figure is misleading using again the seasonal above 20°N Briffa et al. data set as global.

May be also at some point write something supporting the answer of Edouard and Gilles Delaygue, to EPSL (or in answering the letter Courtillot has recently written see attached in which he is very critical with respect to your work). I don't know

Yes I will be in Vienna , this will be a pleasure to meet you With my best Jean

Subject: Re: [Fwd: RE: Dueling climates]
Date: Fri, 18 Jan 2008 05:17:06 -0500
Cc: "Kevin Trenberth" <trenbert@ucar.edu>, "Karl, Tom" <Thomas.R.Karl@noaa.gov>, "Reto Ruedy" <rriedy@giss.nasa.gov>

Thanks, Phil. Here is a way that Reto likes to list the rankings that come out of our version of land-ocean index.

| rank | LOTI |
|--------|-------|
| 1 2005 | 0.62C |
| 2 1998 | 0.57C |
| 2007 | 0.57C |
| 2002 | 0.56C |
| 2003 | 0.55C |
| 2006 | 0.54C |
| 7 2004 | 0.49C |

i.e., the second through sixth are in a statistical tie for second in our analysis. This seems useful, and most reporters are sort of willing to accept it. Given differences in treating the Arctic etc., there will be substantial differences in rankings. I would be a bit surprised is #7 (2004) jumped ahead to be #2 in someone else's analysis, but perhaps even that is possible, given the magnitude of these differences.

Jim

On Jan 18, 2008 5:03 AM, Phil Jones <[1]p.jones@uea.ac.uk> wrote:

Kevin,

When asked I always say the differences are due to the cross-Arctic extrapolation.

Also

as you say there is an issue of SST/MAT coming in from ships/buoys in the Arctic. HadCRUT3 (really HadSST2) doesn't use these where there isn't a 61-90 climatology - a lot of areas with sea ice in most/some years in the base period. Using fixed SST values of -1.8C is possible for months with sea ice, but is likely to be wrong. MAT would be impossible to develop 61-90 climatologies for when sea ice was there. This is an issue that will have to be addressed at some point as the sea ice disappears. Maybe we could develop possible approaches using some AMIP type Arctic RCM simulations?

Agreeing on the ranks is the hardest of all measures. Uncertainties in global averages are of the order of +/- 0.05 for one sigma, so any difference between years of less than 0.1

isn't significant. We (MOHC/CRU) put annual values in press releases, but we also put errors. UK newspapers quote these, and the journalists realise about uncertainties, but prefer to use the word accuracy.

We only make the press releases to get the numbers out at one time, and focus all the calls. We do this through WMO, who want the release in mid-Dec.

There is absolutely no sense of duelling in this. We would be criticised if there were just

one analysis. The science is pushing for multiple analyses of the same measure - partly to make sure people remember RSS and not just believe UAH. As we all know, NOAA/NASA and HadCRUT3 are all much closer than RSS and UAH!

I know we all know all the above. I try to address this when talking to journalists, but they generally ignore this level of detail.

I'll be in Boulder the week after next at the IDAG meeting (Jan 28-30) and another

meeting Jan30/Feb 1. Tom will be also.

Cheers

Phil

Rick, Kevin,

Â

Attached is the NOAA release.Â I believe I had read that the discrepancy with the NASA ("Second hottest year") data/release was also related to how NOAA adjusts for heat island effects and resiteing of climate stations.Â In any event I don't think dueling climate data serves the broad goals of informing/educating the public and decision makers about climate change.Â I can hear some saying, "If NOAA and NASA can't even agree what the temperature was last year, how can we believe what they are saying about the future climate".

Subject: Re: Dueling climates

Hi Rick

My understanding is that the biggest source of this discrepancy is the way the Arctic is analyzed.Â We know that the sea ice was at record low values, 22% lower than the previous low in 2005.Â Some sea temperatures and air temperatures were as much as 7C above normal.Â But most places there is no conventional data.Â In NASA they extrapolate and build in the high temperatures in the Arctic.Â In the other records they do not.Â They use only the data available and the rest is missing.Â In most cases the values from recent years are about statistically tied and the ranking is one that separates values by hundredths of a degree.Â There is no correct way to do this (especially the treatment of missing data), and different groups do it differently. You typically get different answers if you compute the hemispheric means and average them vs computing the global mean, because more data are missing in the southern hemisphere.Â Although this can be addressed using remote

sensing in recent times, the climatologies differ. Ideally one should have a global analysis with no missing data, and this occurs in the global analyses, but they have other problems.

Hope this helps

Kevin

Rick Anthes wrote:

Bob-

I saw the NASA one (GISS) but not the NOAA release. Could you point me toward it? I see your point. These preliminary analyses may change with time and the press releases have not been peer-reviewed. I am surprised the two estimates disagree this much, but the difference is probably well within the uncertainty of the estimate of annual global temperatures. I'd be interested in Kevin's take on this.

Rick

2007 Among Hottest Years on Record:

NASA Scientists Release Global Temperature Analysis

An analysis of 2007 global temperature data undertaken by scientists at Goddard Institute for Space Studies (GISS), New York, reveals that 2007 is

tied with 1998 as the second hottest year on record. The unusual warmth of

2007 is noteworthy because it occurs at a time when solar irradiance is at a minimum and the equatorial Pacific Ocean has entered the cool phase of its

El Niño-La Niña cycle.

The greatest warming in 2007 occurred in the Arctic. Global warming has a

larger affect in polar areas, as the loss of snow and ice leads to more open

water, which absorbs more sunlight and warmth. The large Arctic warm

anomaly of 2007 is consistent with observations of record low Arctic sea ice in September 2007.

The eight warmest years in the GISS record have all occurred since 1998,

with 2005 ranking as the hottest. Barring a large volcanic eruption, NASA

scientists predict that a record global temperature exceeding that of 2005 can be expected within the next two to three years.

A NASA TV Video File on this topic will run January 16th at 9 A.M., 12, 4,

8, and 10 P.M. EDT on the NASA TV media channel (#103).

Video Highlights:

- * Colorful Visualizations of Global Temperature Data from 1880-2007
- * Animations of Unique Perspectives on Ice Albedo
- * Animated Earth Displaying Seasonal Landcover and Arctic Sea Ice
- * Select Interview Clips with NASA Scientist Dr. James Hansen

For high definition video downloads, print resolution still images, and a short web video on taking Earth's temperature, visit:

[15]http://www.nasa.gov/topics/earth/features/earth_temp.html

NASA Television is carried on an MPEG-2 digital signal accessed via satellite AMC-6, at 72 degrees west longitude, transponder 17C, 4040 MHz, vertical polarization. A Digital Video Broadcast (DVB) - compliant Integrated Receiver Decoder (IRD) with modulation of QPSK/DBV, data rate of 36.86 and FEC <= is needed for reception. NASA TV Multichannel Broadcast includes Public Services Channel (#101), the Education Channel (#102) and the Media Services Channel (#103).

FOR IMMEDIATE RELEASE January 15, 2008

*** NEWS FROM NOAA ***

NATIONAL OCEANIC & ATMOSPHERIC ADMINISTRATION

U. S. DEPARTMENT OF COMMERCE

WASHINGTON, DC

Contact: John Leslie, 301-713-2087, ext. 174

NOAA: 2007 Was Tenth Warmest for U.S., Fifth Warmest Worldwide

Â Â Â Â Â The average temperature for the contiguous

U.S. in 2007 is officially the tenth warmest on record, according to data from scientists at

NOAA's National Climatic Data Center in

Asheville, N.C. The agency also determined the global surface temperature last year was the fifth warmest on record.

U.S. Temperature Highlights

- * The average U.S. temperature for 2007 was 54.2 degrees F; 1.4 degrees F warmer than the 20th century mean of 52.8 degrees F. NCDC originally estimated in mid-December that 2007 would end as the eighth warmest on record, but below-average temperatures in areas of the country last month lowered the annual ranking. For Alaska, 2007 was the 15th warmest year since statewide records began in 1918.
- * Six of the 10 warmest years on record for the contiguous U.S. have occurred since 1998, part of a three decade period in which mean temperatures for the contiguous U.S. have risen at a rate near 0.6 degrees F per decade.
- * For the contiguous U.S., the December 2007 mean temperature was 33.6 degrees F, near the 20th century average of 33.4 degrees F. The Southeast was much warmer than average, while 11 states, from the Upper Midwest to the West Coast, were cooler than average.
- * Warmer-than-average temperatures for December 2007 in large parts of the more heavily populated eastern U.S. resulted in temperature related energy demand about 1.9 percent below average for

the nation as a whole, based on NOAA's

Residential Energy Demand Temperature Index. For the year, the REDTI estimates that national residential energy consumption was about 2.5 percent below average.

U.S. Precipitation Highlights December 2007

- * December 2007 was wetter than normal for the contiguous U.S., the 18th wettest December since

national records began in 1895. Thirty-seven states were wetter, or much wetter, than average. Only Texas, Louisiana, Mississippi, and North Dakota were drier than average.

* Precipitation was much above average in Washington state, due to a powerful storm that struck the Pacific Northwest in early December. Heavy rain and wind gusts greater than 100 mph caused widespread damage and the worst flooding in more than a decade in parts of western Oregon and Washington. Many locations received more than 10 inches of rainfall during the first three days of the month.

* While above-average precipitation in late November and December led to improving drought conditions in parts of the Southwest, Southeast, and New England, more than three-fourths of the Southeast and half of the West remained in some stage of drought.

Global Highlights

* For December 2007, the combined global land and ocean surface temperature was the 13th warmest on record (0.72 degrees F or 0.40 degrees C above the 20th century mean). Separately, the global December land-surface temperature was the eighth warmest on record. The most anomalously warm temperatures occurred from Scandinavia to central Asia.

* La Niña continued to strengthen as ocean

surface temperatures in large areas of the central and eastern equatorial Pacific were more than 3 degrees F (1.7 degrees C) below average. The continuation of cooler-than-average temperatures dampened the global ocean average, which was the 18th warmest on record for December.

* For 2007, the global land and ocean surface temperature was the fifth warmest on record. Separately, the global land surface temperature was warmest on record while the global ocean temperature was 9th warmest since records began in 1880. Seven of the eight warmest years on record have occurred since 2001, part of a rise in temperatures of more than 1 degree F (0.6 degrees C) since 1900. Within the past three decades, the rate of warming in global temperatures has been approximately three times greater than the century scale trend.

Hi Jean,
no problem, I think Phil and I have it all sorted out. Sorry I won't be there to see you
this time,
mike
Jean Jouzel wrote:

Dear Phil, Dear Mike,

I feel that I come too late in the discussion, but it's really fine for me.

Thanks a lot Jean

At 14:24 +0000 18/01/08, Phil Jones wrote:

Mike,

I didn't read it properly! I see the Jan 25 deadline. I was looking
at a Feb date which is for room and scheduling options.

So I will let you enter the session on Monday. I'll send
something over the weekend or first thing Monday, once I've
been through them. There a number of issues which relate to
last year and who got orals/posters then.

The other thing is for a room for 250+ people. If we have a medallist
we want more. We had 500 last year (due to Ray) but we did keep
most for the next few talks. We still had about ~200 for the session after
Ray's.

Cheers
Phil

At 14:01 18/01/2008, Michael Mann wrote:

Hi Phil,

thanks--sounds fine, I'll let you enter the session then.

I thought they wanted it sooner though (before Jan 25). I'm forwarding that email, maybe
I misunderstood it,
mike

Phil Jones wrote:

Mike,

Have printed out the abstracts. Looks like many reasonable ones. Pity we only have the limited numbers. I can put the session in once we're agreed. It seems as though we can't do that till mod-Feb.

I've contacted Gerrit and Gerard to see if we have to accommodate a medalist talk for the Hans Oeschger prize.

Cheers

Phil

At 13:15 18/01/2008, Michael Mann wrote:

Hi Phil,

thanks, that sounds fine to me. I'll await further word from you after you look this over again, and I'll await feedback from Jean. No rush, I'm hoping to finalize the session on Monday.

The Vinther et al stuff sounds very interesting--I'm looking forward to hearing more, sorry I won't actually be at EGU.

talk to you later,

mike

Phil Jones wrote:

Mike, Jean

Thanks. I'll probably go with Vinther et al for the third invited. Not just as I'm on the author list, but because he'll show (will submit soon) that the Greenland borehole records (Dorthe Dahl Jensen) are winter proxies. Has implications for the Norse Vikings - as the summer isotopes (which unfortunately respond much to Icelandic than SW Greenland temps) don't show any Medieval warming.

Jean probably knew all this. The bottom line is that annual isotopes are essentially winter isotopes as they vary 2-3 times as much as summer ones. If the squeezing of the layers doesn't distort anything this implies longer series are very winter half year dominant.

I mostly agree with the other orals, but I have to look at a few. There is one on the Millennium project (EU funded) which Jean knows about. Might have to give this an oral slot.

Jean - any thoughts? I assume you're happy to chair a session.

I also need to check whether we will have to talk a medallist talk? No idea who?

Cheers

Phil

Dear Phil and Jean,

We got an impressive turnout this year for our session, 37 total submitted abstracts. Please see attached word document. Based on the rules described by EGU below, I suggest we have 2 oral sessions (consisting of morning and afternoon), with a total of 10 oral presentations w/ 7 of those being regular 15 minutes slots and 3 of those invited 25 minute slots. The other 27 abstracts will be posters, conforming w/ the fairly harsh limits imposed by EGU on oral presentations.

My suggestions would be as follow:

Invited Presentations (25 minutes):

1 Ammann et al

2 Hughes et al

3 either Emile Geay et al OR Vinther et al OR Crespin et al (preferences?)

Other Oral (15 minutes):

4. 3 other of either Emile Geay et al OR Vinther et al OR Crespin et al

5. 3 other of either Emile Geay et al OR Vinther et al OR Crespin et al

6. Riedwyl et al

7. Graham et al

8. Smerdon et al

9. Kleinen et al

10. Jungklaus et al

Posters:

All others

Please let me know what you think. If these sound good to you, I'll go ahead and arrange the session online,

Mike

Dear convener and co-convener,

Thanks a lot for your effort for successful sessions at the EGU 2008.

>From our experience of the last years, there will be an oral-to-poster ratio of about 1:2 (e.g. ~33% of the contributions can get a talk). This means that for a complete session, you need 18 contributions. $18:3 * 15\text{min} = 1.5\text{h} = 1 \text{ block}$

For those of you who are under the number of 18, there are several options:

- 1) a pure poster session
- 2) merging with a related session
- 3) the contributions will go to the open session (CL0)
- 4) if you are just below 18, you may manage to get late contributions within the next days (please no dummy posters)

Please tell me which option do you like most (email to [116]andrea.bleyer@awi.de).

In case 2), please contact the respective conveners in advance.

The session could be also from other divisions (BG, OS, AS, IS, ..).

In case of merging, you may speak with the persons whether it would be appropriate to modify the title of the new session or to have a combined name with both titles.

I think the general rule is that the convener of the merged session is the person with the bigger session.

Kind regards

Gerrit

Phil,

will do. And regarding TSI, it looks like that 1361 or 1362 (+/-) are going to be the new consensus. All I hear is that this seems to be quite robust. Fodder for the critics: all these modelers, they always put in too much energy - no wonder it was warming - and now they want to reduce the natural component? The SORCE meeting is going to be on that satellite stuff but also about climate connections : Sun-Earth. Tom Crowley is going to be there, Gavin Schmidt, David Rind, and a few others; of course Judith.

Thanks for Bo Vinther's manuscript!

Caspar

On Jan 30, 2008, at 3:12 PM, [1]P.Jones@uea.ac.uk wrote:

Caspar,

OK. Keep me informed. Also I'd like to know more the conclusions of the meeting you're going to on the solar constant.

Just that it can change from 1366.5 to 1361!!

Cheers

Phil

Phil,

we should hook together on this 1257 event (I call it 1257 because of the timings but its just a bit better than an informed guess). We now have these simulations of contemporary high-lat eruptions and can

compare them with low-lat ones.

Just a couple thoughts

pro high-lat:

- climate signal looks better in short and longer term
- potential for in-ice-core migration of some sulfur species ... some

new work that has been done ...

con:

- deposition duration
- old fingerprints
- no high-lat calderas/flows of appropriate size : compare it to

Eldgja or Laki, this thing is bigger!

- no large ash layers

What we need is fingerprinting. I'm participating in a project

Icelandic volcanism and climate in the last 2000 years. There we have

money to do some chemical fingerprinting. I'm pursuing to get

somebody to run these samples. That will be the deciding thing.

Remember, instrumentation has dramatically increased in sensitivity,

so I think it should be possible. its not that one would have to go

dig around too much in the ice cores as the depth/location of that

monster sulfate spikes are well known.

Should be interesting.

Caspar

On Jan 30, 2008, at 2:57 PM, [2]P.Jones@uea.ac.uk wrote:

Caspar,

The meeting I'm at is less interesting than IDAG.

I'll send the Greenland isotope data when I get back.

536 is a good story. 1258/9 needs to be good story too...

I think it isn't at the moment.

Cheers

Phil

Thanks Phil,

will have a look. I certainly like it, and I only was a bit picky on

the "largest eruption" versus "largest volcanic signal in trees". I

like the isotope work very much and will now look if I can pick on

something more substantial ;-)

<x-flowed>

Dear All,

I would like to respond to some of the items in the attached text on issues etc. in particular to the statement in the section 3.1.1 (sections 3: Drivers of required change in the future).

"There is now greater demand for a higher level of policy relevance in the work of IPCC, which could provide policymakers a robust scientific basis for action".

1. While it is true that a vast majority of the public and the policymakers have accepted the reality of human influence on climate change (in fact many of us were arguing for stronger language with a higher level of confidence at the last meetings of the LAs), how confident are we about the projected regional climate changes?

I would like to submit that the current climate models have such large errors in simulating the statistics of regional (climate) that we are not ready to provide policymakers a robust scientific basis for "action" at regional scale. I am not referring to mitigation, I am strictly referring to science based adaptation.

For example, we can not advise the policymakers about re-building the city of New Orleans - or more generally about the habitability of the Gulf-Coast - using climate models which have serious deficiencies in simulating the strength, frequency and tracks of hurricanes.

We will serve society better by enhancing our efforts on improving our models so that they can simulate the statistics of regional climate fluctuations; for example: tropical (monsoon depressions, easterly waves, hurricanes, typhoons, Madden-Julian oscillations) and extratropical (storms, blocking) systems in the atmosphere; tropical instability waves, energetic eddies, upwelling zones in the oceans; floods and droughts on the land; and various manifestations (ENSO, monsoons, decadal variations, etc.) of the coupled ocean-land-atmosphere processes.

It is inconceivable that policymakers will be willing to make billion-and trillion-dollar decisions for adaptation to the projected regional climate change based on models that do not even describe and simulate the processes that are the building blocks of climate variability. Of course, even a hypothetical, perfect model does not guarantee accurate prediction of the future regional climate, but at the very least, our suggestion for action will be based on the best possible

science.

It is urgently required that the climate modeling community arrive at a consensus on the required accuracy of the climate models to meet the "greater demand for a higher level of policy relevance".

2. Is "model democracy" a valid scientific method? The "I" in the IPCC desires that all models submitted by all governments be considered equally probable. This should be thoroughly discussed, because it may have serious implications for regional adaptation strategies. AR4 has shown that model fidelity and model sensitivity are related. The models used for IPCC assessments should be evaluated using a consensus metric.

3. Does dynamical downscaling for regional climate change provide a robust scientific basis for action?

Is there a consensus in the climate modeling community on the validity of regional climate prediction by dynamical downscaling? A large number of dynamical downscaling efforts are underway worldwide. This is not necessarily because it is meaningful to do it, but simply because it is possible to do it. It is not without precedent that quite deficient climate models are used by large communities simply because it is convenient to use them. It is self-evident that if a coarse resolution IPCC model does not correctly capture the large-scale mean and transient response, a high-resolution regional model, forced by the lateral boundary conditions from the coarse model, can not improve the response. Considering the important role of multi-scale interactions and feedbacks in the climate system, it is essential that the IPCC-class global models themselves be run at sufficiently high resolution.

Regards,
Shukla

From: David Thompson <davet@atmos.colostate.edu>
To: Phil Jones <p.jones@uea.ac.uk>
Subject: Re: Your ENSO series
Date: Thu, 21 Feb 2008 14:07:14 +0000

Phil,

If it works, let's plan on me visiting for the day April 30 (I'll come out April 29; leave May 1). I'll put the date on my calendar and assume it works unless I hear otherwise. If there is a better day that week, please let me know.

Thanks,

Dave

Dave,

Will send on your details to the seminar organizer here. The week of April 28 - May 2 is OK for me. I hope this is what you meant by last week.

A few thoughts on the plots.

1. There isn't a drop off in land data around 1945 - nor during WW2. So this is different from the ocean data. Most series are complete or have been slightly infilled during the period in Europe. Berlin for example only missed one day's T obs in April 45.
2. Fuego could be underestimated.
3. It could also be that sulphate emissions were very high at this time - late 60s, early 70s.

I'll await the text !

Cheers

Phil

At 16:18 19/02/2008, you wrote:

Hi Phil,

I'd enjoy visiting.... how does the first or last week of April look to you?

As for some new results:

I've attached two figures. Both focus on the land data.

The first figure includes 4 time series. From top to bottom: the global-mean land data (CRUTEM 3); the ENSO fit; the COWL fit; the residual global-mean time series. There is nothing here you haven't seen before - the residual land time series is identical to the one in the Nature paper.

As we've discussed, the residual land time series highlights the signature of the volcanos. And as far as low frequency variability goes: the residual land time series supports the IPCC contention that the global warmed from ~1900-1940; did not warm from ~1940-1980; and warmed substantially from 1980 to present.

OK.... so now I'm going to play with removing the volcanic signal. There are a lot of ways to do this, and I haven't settled on the best method. For now, I am driving the simple climate model I've been using for ENSO with the Ammann et al. volcanic forcing time series. I get identical results using Crowley's estimate and Sato's estimate. The figure on page 2 shows the effect of removing the volcanic signal. From top to bottom: the the global-mean residual land time series (repeated from the previous figure); the volcanic fit; the 'ENSO/COWL/Volcano' residual land time series.

Some key points:

1. the volcanic fit isn't perfect, but captures most of the volcanic signal.
2. the residual time series (bottom of Fig 2) is interesting. If you look closely, it suggests the globe has warmed continuously since 1900 with two exceptions: a 'bite' in the 1970s, and a downwards 'step' in 1945. The step in 1945 is not as dramatic as the step in the ocean data. But it's there. (I'm guessing the corresponding change in variance is due to a sudden increase in data coverage).
3. the volcanic fit highlights the fact that the lack of warming in the middle part of the century comes from only two features: the step in 45 and Agung. When Agung is removed, land temperatures march upwards from 1945-1970 (Fig 2 bottom).
4. the bite in the 1970s could be due to an underestimate of the impact of Fuego (the bite is also evident in the SST data).

What do you think? The step in 1945 is not as dramatic as the step in the SST data. But it's certainly there. It's evident in the COWL/ENSO residual time series (top of Fig 2): removing Agung simply clarifies that without the step temperatures marched steadily upwards from 1900-1970.

Phil,
I'm really sorry for the delay; my family and I have been in transit from the US to the UK this past week, and it's taken a bit for us to get settled.
I've attached the ENSO index I've been using. The first month is Jan 1850; the last is Dec 2006. The time series has a silly number of sig figures - that's just how Matlab wanted to save it.

The data are in K and are scaled as per the fit to the global-mean (as in the paper).
I've got some new results regarding the land data... I'll think you'll find them interesting. I'll pass them along in the next day or so... the main point is that I suspect the land data might also have some spurious cooling in the middle part of the century. More to come....

-Dave

On Feb 14, 2008, at 12:35 PM, Phil Jones wrote:

David,

For a presentation I'm due to make in a few months, can you send me the ENSO and the COWL series that are in Figure 1 in the paper. I'm not sure what I will do with COWL, but I want to compare your ENSO

with some of the ENSO-type indices I have.

These seem monthly from about the 1860s or maybe earlier.

Cheers

Phil

Subject: Nature 2008-01-00939 out to review

Dear Professor Thompson,

Thank you for submitting your manuscript entitled "A discontinuity in the time series of global-mean surface temperature" to Nature. I am pleased to tell you that we are sending your paper out for review.

We will be in touch again as soon as we have received comments from our reviewers.

Yours sincerely

Nichola O'Brien

<x-flowed>

Dear Phil,

A quick question: Do you happen to have a "percentage land coverage mask" for the HadCRUT3v data? And if so, does this exist as a netCDF file?

With best regards,

Ben

>>

>> I've now done the "paired trends" test with the trends in the
>> surface-minus-T2LT difference series. The results are quite
>> interesting. They are at variance with the above-quoted finding of the
>> CCSP Report. The new results I will describe show that the "potential
>> discrepancies" in the tropics have largely been resolved.

>>

>> Here's what I did. I used three different observational estimates of
>> tropical SST changes. These were from NOAA-ERSST-v2, NOAA-ERSST-v3,
>> and HadISST1. It's my understanding that NOAA-ERSST-v3 and HadISST1
>> are the most recent SST products of NCDC and the Hadley Centre. I'm
>> also using T2LT data from RSS v3.0 and UAH v5.2. Here are the tropical
>> (20N-20S) trends in these five datasets over the 252-month period from
>> January 1979 to December 1999, together with their 1-sigma adjusted
>> standard errors (in brackets):

>>

>> UAH v5.2 0.060 (+/-0.137)

>> RSS v3.0 0.166 (+/-0.130)

>> HADISST1 0.108 (+/-0.133)

>> NOAA-ERSST-v2 0.100 (+/-0.131)

>> NOAA-ERSST-v3 0.077 (+/-0.121)

>>

>> (all trends in degrees C/decade).

>>

>> The trends in the three SST datasets are (by definition) calculated from anomaly data that have been spatially-averaged over tropical oceans. The trends in T2LT are calculated from anomaly data that have been spatially averaged over land and ocean. It is physically reasonable to do the differencing over different domains, since the temperature field throughout the tropical troposphere is more or less on the moist adiabatic lapse rate set by convection over the warmest waters.

>>

>> These observational trend estimates are somewhat different from those available to us at the time of the CCSP Report. This holds for both T2LT and SST. For T2LT, the RSS trend used in the CCSP Report and in the Santer et al. (2005) Science paper was roughly 0.13 degrees C/decade. As you can see from the Table given above, it is now ca. 0.17 degrees C/decade. Carl tells me that this change is largely due to a change in how he and Frank adjust for inter-satellite biases. This adjustment now has a latitudinal dependence, which it did not have previously.

>>

>> The tropical SST trends used in the CCSP Report were estimated from earlier versions of the Hadley Centre and NOAA SST data, and were of order 0.12 degrees C/decade. The values estimated from more recent datasets are lower - and markedly lower in the case of NOAA-ERSST-v3 (0.077 degrees C/decade). The reasons for this downward shift in the estimated warming of tropical SSTs are unclear. As Carl pointed out in an email that he sent me earlier today:

>>

>> "One important difference is that post 1985, NOAA-ERSST-v3 directly ingests "bias adjusted" SST data from AVHRR, a big change from v2, which didn't use any satellite data (directly). AVHRR is strongly affected in the tropics by the Pinatubo eruption in 1991. If the "bias adjustment" doesn't completely account for this, the trends could be changed".

>>

>> Another possibility is treatment of biases in the buoy data. It would be nice if Dick Reynolds could advise us as to the most likely

>> explanation for the different warming rates inferred from

>> NOAA-ERSST-v2 and v3.

>>

>> Bottom line: The most recent estimates of tropical SST changes over
>> 1979 to 1999 are smaller than we reported in the CCSP Report, while
>> the T2LT trend (at least in RSS) is larger. The trend in the observed
>> difference series, NOAA-ERSST-v3 Ts minus RSS T2LT, is now -0.089
>> degrees C/decade, which is very good agreement with the multi-model
>> ensemble trend in the Ts minus T2LT difference series (-0.085 degrees
>> C/decade). Ironically, if Douglass et al. had applied their flawed
>> "consistency test" to the multi-model ensemble mean trend and the

Subject: Re: Adjusting Beijing temperature series
Date: Fri Feb 22 10:14:36 2008

Zhongwei,

Will read soon !

Attached is what I finally submitted to JGR.

Don't pass on to anyone else.

I have also received a paper from Li, Q, but have yet to read that. He only sent it yesterday.

Cheers

Phil

At 09:55 22/02/2008, you wrote:

Hi, Phil,

Attached please find a draft paper about site-changes and urbanization at Beijing. It may be regarded as an extension of our early work (Yan et al 2001 AAS) and therefore I would be happy to ask you to join as a co-author.

Regarding your recent paper about UHI effect in China (no doubt upon a large-scale warming in the region), I hope the Beijing case may serve as a helpful rather than a contradictory (as it may appear so) reference.

The urbanization-bias at BJ was considerable but could hardly be quantified. I suspect it was somehow overestimated by a recent work (Ren et al 2007). Please feel free to comment and revise.

I'll check and complete the reference list, while you may also add in new references

Cheers

Zhongwei

Dear Melissa,

Thanks for your comments on the IJoC paper. Here are a few quick responses.

I do feel comfortable with use of SSTs (rather than combined land+ocean temperatures) to estimate changes in tropical lapse rates. As Isaac Held pointed out, the temperature of the free troposphere in the deep tropics follows a moist adiabat which is largely set by the warmest SSTs in areas experiencing convection. The temperature of the free troposphere in the deep tropics is not set by temperatures over land. So if you want to see whether observations and models show lapse-rate changes that are in accord with a moist adiabatic lapse rate theory, it makes sense to look at SSTs rather than combined land+ocean surface temperatures. Admittedly, the focus of this paper is NOT on amplification behavior. Still, it does make sense to look at tropical lower tropospheric lapse rates in terms of their primary physical driver: SSTs.

As I tried to point out in the text of the IJoC paper, models and RSS-based estimates of lapser-rate changes are consistent, even if lapse-rate changes are inferred from combined land+ocean surface temperatures. The same same does not hold for lapse rate changes

estimated from HadCRUT3v and UAH data. I must admit that I don't fully understand the latter result. If you look at Table 1, you'll see that the multi-model ensemble-mean temporal standard deviation of $T\{SST\}$ is 0.243 degrees C, while the multi-model ensemble-mean temporal standard deviation of $T\{L+O\}$ is higher (0.274 degrees C). This makes good physical sense, since noise is typically higher over land than over ocean. Yet in the HadCRUT3v data, the temporal standard deviation of $T\{L+O\}$ (0.197 degrees C) is very similar to that of $T\{SST\}$ for the HadISST1 and HadISST2 data (HadISST2 is the SST component of HadCRUT3v). The fact that HadCRUT3v appears to have very similar variability over land and ocean seems counter-intuitive to me. Could it indicate a potential problem in the tropical land 2m temperatures in HadCRUT3v? I don't know. I'll let Phil address that one. The point is that we've done - at least in my estimation - a thorough job of looking at the sensitivity of our significance test results to current observational uncertainties in surface temperature changes.

> 2. The conclusion seems like too much of a dissertation on past history
> of the controversy.

As I pointed out in my email of Feb. 26th, I had a specific concern about the "Summary and Conclusions" section. I think that many readers of the paper will skip all the statistical stuff, and just read the Abstract and the "Summary and Conclusions". I did want the latter section to be relatively self-contained. We could have started by saying: "Here are the errors in Douglass et al., and here is what we found". But on balance, I thought that it would be more helpful to provide some scientific context. As I mentioned this morning, the Douglass et al. paper has received attention in high places. Not everyone who reads our response will be apprised of the history and context.

To: Phil Jones <p.jones@uea.ac.uk>
Subject: Re: Past Millennia Climate Variability - Review Paper
Date: Thu, 13 Mar 2008 08:58:49 -0400
Reply-to: mann@psu.edu

Hi Phil,

Sorry, one other point. In item #4 below, the point that is being made, as shown (and discussed) elsewhere, applies both to the MBH method and the the canonical regression method (the latter is demonstrated in experiments by Wahl and Ammann not shown but referred to elsewhere in the text). So to be accurate and fair, the sentence in question on page 50 really has to be rephrased as follows:

Examinations of this kind are shown in Figures 3a,b (and parallel experiments not shown) demonstrating that, at least for the truncated-EOF CFR method used by MBH98 (employing inverse regression) and the canonical regression method that has been widely used by many other paleoclimate researchers, there is some degree of sensitivity to the climatological information available in calibration.

I realize there are many co-authors on the paper that have used the canonical regression method before, so perhaps there is pressure to focus the criticism on the MBH method. But that is simply not fair, as the other analyses by Wahl and Ammann not shown clearly demonstrates this applies to canonical regression as well--we can debate the relative sensitivity of the two methods, but it is similar.

This is an absolutely essential issue from my point of view, and I'm afraid I cannot sign my name to this paper w/out this revision.

I'm sure you understand--thanks for your help,
mike

Michael Mann wrote:

Phil,

Looks mostly fine to me now. I'm in Belgium (w/ the Louvain crowd) and only intermittent internet access, so will be difficult to provide much more feedback than the below. I hope that is ok? Here are my remaining minor comments:

1) the author list is a bit front-loaded w/ CRU folks. You should certainly be the first author, but the remaining order makes this paper look more like a "CRU" effort than a "Wengen" effort, and perhaps that will have an unintended impact on the way the paper is received by the broader community. I was also wondering how I ended up so far down the list :(

I think I was one of the first to provide a substantive contribution to the paper. Was my contribution really so minor compared to those others? The mechanism behind the author list is unclear, partially alphabetical (towards the end), but partly not. You are of course the best judge of peoples' relative contributions, and if the current author order indeed represents that according to your judgment, then I'm fine w/ that. Just thought I'd check

though.

2) page 45, 2nd paragraph, should substitute "(e.g. Shindell et al, 2001; Collins et al 2002)" for "Collins et al 2002"

3) page 48, 2nd paragraph, 3rd sentence, should substitute "RegEM (implemented with TTLS as described by Mann et al 2007) for "RegEM".

4) page 50, bottom paragraph, first sentence: I think that the use of "crucially" here is unnecessarily inflammatory and overly dramatic. This word can be removed without any detriment to the point being made, don't you think?

5) page 51, 2nd paragraph, logic does not properly follow in certain places as currently phrased (a frequent problem w/ Eugene's writing unfortunately!):

a. sentence beginning at end of line 9 of paragraph, should be rephrased as follows:

Mann et al. (2005) used pseudo-proxy experiments that apparently showed that this method did not underestimate the amplitude of the reconstructed NH temperature anomalies: however, Smerdon and Kaplan (2007) show that this may have been a false positive result arising from differences between the implementation of the RegEM algorithm in the pseudo-proxy experiments and in the real-proxy reconstructions which leads to a sensitivity of the pseudoproxy results to the calibration period used (also noted by Lee et al., 2008).

b. the sentence following the one above should be rephrased:

Mann et al. (2007; cf. their Figs. 3-4) demonstrate that a variant of the RegEM method that uses TTLS, rather than ridge regression produces an NH temperature reconstruction whose amplitude fidelity does not exhibit the calibration interval dependence of the previous implementation by Mann et al 2005, and yields reconstructions that do not suffer from amplitude loss for a wide range of signal-to-noise ratios and noise spectra (though Lee et al., 2008, suggest that an appropriately implemented ridge regression can also produce good results).

c. the sentence following the one above should be rephrased:

With TTLS as implemented by Mann et al (2007), RegEM performs without amplitude loss in model-based tests (versions without trend removal), including using the high-amplitude ECHO-G model output utilized by Bürger et al. (2006), von Storch et al. (2006), and Küttel et al. (2007) to examine truncated-EOF methods.

6) page 52, 1st paragraph, 7th line, the reference of "the MBH reconstruction" is erroneous, because the tests have nothing to do w/ the MBH reconstruction per se, only--potentially--the MBH method under certain circumstances. In fact, Mann et al (2007) [and Wahl and Amman(2007)] both show that the actual amplitude loss realized in the MBH reconstruction in reality is probably quite small. This very point is made at the top of page 53! So the reference to "the MBH reconstruction" needs to be eliminated here. It is already clear by context what this is actually referring to (idealized experiments using both the MBH and canonical applied to surrogate proxy networks).

7) Re, Caspar--well he seems to be in his "non-responsible" phase right now, hasn't replied to my messages either. Will keep on trying, let me know if any of the above needs further elaboration. we're travelling for the weekend but will still have intermittent email access,
mike

Phil Jones wrote:

Dear All,

Attached is the penultimate draft of the Wengen paper. If you have time can you look

through this. If you've not much time, can you look through your sections and the intro/conclusions. I hope we in CRU have got all your comments in. We have been through them all - including Gene's which came last night and Francis' the night before.

WE URGENTLY NEED CASPAR TO REpond. Can Gene, Mike and anyone who can get Caspar to respond to emails tell him that there are a few questions in this draft we need him to respond to. We need better versions of Figure 3, plus there are some flagged points in Sections 3 and 4.

Juerg - is Figure 5 OK. If not resend separately - don't embed as this screwed up last time.

Plan A is for us to submit this to The Holocene next Wednesday. So we need by then, from each of you a quick email to say you've got this and any comments by next Monday - March 17. Submission will be March 19. There is no Plan B.

With the Feb 20 email, there were no responses from Peck, Eystein and Nick. If we don't hear from you three by next week, we will remove you from the author list! If anyone knows if any of these three are in the field please let me know?

Things to check:

1. Everybody happy with the author order. The idea here was the three us in CRU, the main authors of the sections in section order, then others in alphabetical order.
2. If you have time also look at sections 2.5 and 2.6. Issue here is - is there enough there. Thanks to Juerg for some of these sections.
3. There are a couple of refs (Juerg) we need - Buntgen et al. and D'Arrigo et al. Next week, we (CRU) will be working on the alterations- using IPCC rules. These are - if you want a change justify it, and if you say this is unbalanced, or just European, or emphasizes Lee et al. (2008), then gives us the additional text to make alterations. We've left a few comments in where these sorts of comments were made last time.

There will be time to make alterations while The Holocene reviews it. It will also be better to read it later when there is time after submission.

I've not read this version yet, so apologies if there are any pieces of poor English. I will be reading again this weekend.

Finally, Thorsten, if you think I've missed anybody off this email, forward and let me know.

Juerg needs to send on to the others within Bern.

Cheers

Phil

Hi Chris (and Tom and Phil),

I hope you're all doing well. Just wanted to give you a heads up on something. Have you seen this?

http://hadobs.metoffice.com/hadcrut3/diagnostics/global/nh+sh/annual_s21.png

apparently the contrarians are having a field day w/ this graph. My understanding that it is based on using only Jan+Feb 08 and padding w/ that final value.

Surely this can't be?? Is Fred Singer now running the UK Met Office website?

Would appreciate any info you can provide,

mike

Peck et al,

I recall meeting David Deeming at a meeting years ago (~10). He worked in boreholes then. I've seen his name on several of the skeptic websites.

Kevin's idea is a possibility. I wouldn't post on the website 'ukweatherworld'.

The person who sent you this is likely far worse. This is David Holland. He is a UK citizen who send countless letters to his MP in the UK, writes in Energy & Environment about the biased IPCC and has also been hassling John Mitchell about his role as Review Editor for Ch 6. You might want to talk to John about how he's responding. He has been making requests under our FOI about the letters Review Editors sent when signing off. I'm sure Susan

is aware of this. He's also made requests for similar letters re WG2 and maybe 3.

Keith has been in contact with John about this.

I've also seen the quote about getting rid of the MWP - it would seem to go back many years, maybe even to around the TAR. I've no idea where it came from. I didn't say it!

I've written a piece for RMS [popular journal Weather on the MWP and LIA - from a UK perspective. It is due out in June. I can send if you want.

I'm away all next week - with Mike. PaleoENSO meeting in Tahiti - you can't turn those sorts of meetings down!

Cheers
Phil

Hey Chris,

In Tahiti (w/ Phil), limited email. Thanks so much for the detailed response. I also heard from David about this, who had similar. sounds like you guys are on top of this. The contrarians will cry conspiracy once the spurious plot is taken down and replaced w/ a corrected one, but what you can do.

I'm sorry to hear you're retiring from the Met Office, but sounds like you're going to remain active, which is great. lets catch up on things sometime soon more generally!

talk to you later,

mike

Geoff,

Have had a look through. I hope all will read their own CVs and institution bits.

My caught one word in Suraje's paragraph. The word was 'severed'. It should be

'served' ! Also his promising suit of methods would read better as a 'suite'

Finally in Mark's he's a Principal Investigator.

Cheers

Phil

Dear all,

Thanks to everyone for sending text etc, in particular to Jim and Chris for the succinct

answer to ET1.

Please find attached (1) the full PQQ, minus Experience and Technical (ET) text, for

information; (2) the ET text, for review.

I'd be grateful for your review of the ET text. In particular (a) please comment on my

draft table in ET2 - I have done my best to capture my knowledge of CRU and Tyndall

skills with respect to the criteria, but you are clearly better placed than me! (b) do

you think the CVs cover the technical areas adequately? We may be a little weak on

conservation and ecology. We have a good CV we can add here, and I'm sure Tyndall has

too (e.g. Andrew) but that would mean taking another out.

We are exploring a link with the specialist communications consultancy Futerra, but

apart from a brief mention, we leaving anything else on this to the full bid stage.

I'd be grateful if you would let me have any comments by 4pm today. This will give me

time to finalise the document and email it first thing tomorrow.

Best wishes,

Geoff

<x-flowed>

Dear folks,

I'm forwarding an email from Prof. Glenn McGregor, the IJoC editor who is handling our paper. The email contains the comments of Reviewer #1, and notes that comments from two additional Reviewers will be available shortly.

Reviewer #1 read the paper very thoroughly, and makes a number of useful comments. The Reviewer also makes some comments that I disagree with.

The good news is that Reviewer #1 begins his review (I use this personal pronoun because I'm pretty sure I know the Reviewer's identity!) by affirming the existence of serious statistical errors in DCPS07:

"I've read the paper under review, and also DCPS07, and I think the present authors are entirely correct in their main point. DCPS07 failed to account for the sampling variability in the individual model trends and, especially, in the observational trend. This was, as I see it, a clear-cut statistical error, and the authors deserve the opportunity to present their counter-argument in print."

Reviewer #1 has two major concerns about our statistical analysis. Here is my initial reaction to these concerns.

CONCERN #1: Assumption of an AR-1 model for regression residuals.

In calculating our "adjusted" standard errors, we assume that the persistence of the regression residuals is well-described by an AR-1 model. This assumption is not unique to our analysis, and has been made in a number of other investigations. The Reviewer would "like to see at least some sensitivity check of the standard error formula against alternative model assumptions." Effectively, the Reviewer is asking whether a more complex time series model is required to describe the persistence.

Estimating the order of a more complex AR model is a tricky business. Typically, something like the BIC (Bayesian Information Criterion) or AIC (Akaike Information Criterion) is used to do this. We could, of course, use the BIC or AIC to estimate the order of the AR model that

best fits the regression residuals. This would be a non-trivial undertaking. I think we would find that, for different time series, we would obtain different estimates of the "best-fit" AR model. For example, 20c3m runs without volcanic forcing might yield a different AR model order than 20c3m runs with volcanic forcing. It's also entirely likely (based on Rick Katz's experience with such AR model-fitting exercises) that the AIC- and BIC-based estimates of the AR model order could differ in some cases.

As the Reviewer himself points out, DCPS07 "didn't make any attempt to calculate the standard error of individual trend estimates and this remains the major difference between the two paper." In other words, our paired trends test incorporates statistical uncertainties for both simulated and observed trends. In estimating these uncertainties, we account for non-independence of the regression residuals. In contrast, the DCPS07 trend "consistency test" does not incorporate ANY statistical uncertainties in either observed or simulated trends. This difference in treatment of trend uncertainties is the primary issue. The issue of whether an AR-1 model is the most appropriate model to use for the purpose of calculating adjusted standard errors is really a subsidiary issue. My concern is that we could waste a lot of time looking at this issue, without really enlightening the reader about key differences between our significance testing testing procedure and the DCPS07 approach.

One solution is to calculate (for each model and observational time series used in our paper) the parameters of an AR(K) model, where K is the total number of time lags, and then apply equation 8.39 in Wilks (1995) to estimate the effective sample size. We could do this for several different K values (e.g., K=2, K=3, and K=4; we've already done the K=1 case). We could then very briefly mention the sensitivity of our "paired trend" test results to choice of order K of the AR model. This would involve some work, but would be easier to explain than use of the AIC and BIC to determine, for each time series, the best-estimate of the order of the AR model.

CONCERN #2: No "attempt to combine data across model runs."

The Reviewer is claiming that none of our model-vs-observed trend tests made use of data that had been combined (averaged) across model runs. This is incorrect. In fact, our two modified versions of the DCPS07 test (page 29, equation 12, and page 30, equation 13) both make use of the multi-model ensemble-mean trend.

The Reviewer argues that our paired trends test should involve the ensemble-mean trends for each model (something which we have not done) rather than the trends for each of 49 individual 20c3m realizations. I'm not sure whether the rationale for doing this is as "clear-cut" as the Reviewer contends.

Furthermore, there are at least two different ways of performing the paired trends tests with the ensemble-mean model trends. One way (which seems to be what the Reviewer is advocating) involves replacing in our equation (3) the standard error of the trend for an individual

realization performed with model A with model A's intra-ensemble standard deviation of trends. I'm a little concerned about mixing an estimate of the statistical uncertainty of the observed trend with an estimate of the sampling uncertainty of model A's trend.

Alternately, one could use the average (over different realizations) of model A's adjusted standard errors, or the adjusted standard error calculated from the ensemble-mean model A time series. I'm willing to try some of these things, but I'm not sure how much they will enlighten the reader. And they will not help to make an already-lengthy manuscript any shorter.

The Reviewer seems to be arguing that the main advantage of his approach #2 (use of ensemble-mean model trends in significance testing) relative to our paired trends test (his approach #1) is that non-independence of tests is less of an issue with approach #2. I'm not sure whether I agree. Are results from tests involving GFDL CM2.0 and GFDL CM2.0 temperature data truly "independent" given that both models were forced with the same historical changes in anthropogenic and natural external forcings? The same concerns apply to the high- and low-resolution versions of the MIROC model, the GISS models, etc.

I am puzzled by some of the comments the Reviewer has made at the top of page 3 of his review. I guess the Reviewer is making these comments in the context of the pair-wise tests described on page 2. Crucially, the comment that we should use "...the standard error if testing the average model trend" (and by "standard error" he means DCPS07's $\sigma\{SE\}$) IS INCONSISTENT with the Reviewer's approach #3, which involves use of the inter-model standard deviation in testing the average model trend.

And I disagree with the Reviewer's comments regarding the superfluous nature of Section 6. The Reviewer states that, "when simulating from a know (statistical) model... the test statistics should by definition give the correct answer. The whole point of Section 6 is that the DCPS07 consistency test does NOT give the correct answer when applied to randomly-generated data!

In order to satisfy the Reviewer's curiosity, I'm perfectly willing to repeat the simulations described in Section 6 with a higher-order AR model. However, I don't like the idea of simulation of synthetic volcanoes, etc. This would be a huge time sink, and would not help to illustrate or clarify the statistical mistakes in DCPS07.

It's obvious that Reviewer #1 has put a substantial amount of effort into reading and commenting on our paper (and even performing some simple simulations). I'm grateful for the effort and the constructive comments, but feel that a number of comments are off-base. Am I misinterpreting the Reviewer's comments?

With best regards,

Ben

JOC-08-0098 - Consistency of Modelled and Observed Temperature Trends in the Tropical Troposphere

Dear Dr Santer

I have received one set of comments on your paper to date. Although I would normally wait for all comments to come in before providing them to you, I thought in this case I would give you a head start in your preparation for revisions. Accordingly please find attached one set of comments. Hopefully I should have two more to follow in the near future.

Best,

Prof. Glenn McGregor

<x-flowed>
Dear folks,

On April 11th, I received an email from Prof. Glenn McGregor at IJoC. I am now forwarding that email, together with my response to Prof. McGregor.

Prof. McGregor's email asks for my opinion of an "Addendum" to the original DCPS07 IJoC paper. The addendum is authored by Douglass, Christy, Pearson, and Singer. As you can see from my reply to Prof. McGregor, I do not think that the Addendum is worthy of publication. Since one part of the Addendum deals with issues related to the RAOBCORE data used by DCPS07 (and by us), Leo responded to Prof. McGregor on this point. I will forward Leo's response in a separate email.

The Addendum does not reference our IJoC paper. As far as I can tell, the Addendum represents a response to discussions of the original IJoC paper on RealClimate.org. Curiously, Douglass et al. do not give a specific source for the criticism of their original paper. This is rather bizarre. Crucially, the Addendum does not recognize or admit ANY ERRORS in the original DCPS07 paper.

I have not yet heard whether IJoC intends to publish the Addendum. I'll update you as soon as I have any further information from Prof. McGregor.

With best regards,

Ben

<x-flowed>

Dear Prof. McGregor,

Thank you for your email, and for your efforts to ensure rapid review of our paper.

Leo Haimberger (who has led the development of the RAOBCORE* datasets) and Peter Thorne would be best placed to comment on the first issue raised by the Douglass et al. "Addendum". As we show in Figure 6 of our IJoC paper, recently-developed radiosonde datasets which do not rely on reanalysis data for correction of inhomogeneities (such as the Sherwood et al. IUK product and the Haimberger et al. "RICH" dataset) yield vertical profiles of atmospheric temperature change that are in better agreement with model results, and quite different from the profiles shown by Douglass et al.

The second issue raised in the Douglass et al. "Addendum" is completely spurious. Douglass et al. argue that their "experimental design" involves involves "comparing like to like", and satisfying "the critical condition that the model surface temperatures match the observations". If this was indeed their experimental design, Douglass et al. should have have examined "AMIP" (Atmospheric Model Intercomparison Project) simulations, in which an atmospheric model is run with prescribed changes in observed time-varying sea-surface temperatures (SSTs) and sea-ice distributions. Use of AMIP simulations would allow an analyst to compare simulated and observed tropospheric temperature changes given the same underlying changes in SSTs.

But Douglass et al. did NOT consider results from AMIP simulations, even though AMIP data were freely available to them (AMIP data were in the same "CMIP-3" archive that Douglass et al. accessed in order to obtain the model results analyzed in their original IJoC paper). Instead, Douglass et al. examined results from coupled model simulations. As we discuss at length in Section 3 of our paper, coupled model simulations are fundamentally different from AMIP runs. A coupled model is NOT driven by observed changes in SSTs, and therefore would not have (except by chance) the same SST changes as the real world over a specific period of time.

Stratifying the coupled model results by the observed surface temperature changes is not a meaningful or useful thing to do, particularly given the small ensemble sizes available here. Again, if Douglass et al. were truly interested in imposing "the critical condition that the model surface temperatures match the observations", they should have examined AMIP runs, not coupled model results.

I also note that, although Douglass et al. stipulate their "critical condition that the model surface temperatures match the observations", they do not actually perform any stratification of the model trend results! In other words, Douglass et al. do NOT discard simulations with surface trends that differ from the observed trend. They simply note that the MODEL AVERAGE surface trend is close to the observed surface trend, and state that this agreement in surface trends allows them to evaluate whether the model average upper air trend is consistent with observed upper air trends.

The Douglass et al. "Addendum" does nothing to clarify the serious statistical flaws in their paper. Their conclusion - that modelled and observed upper air trends are inconsistent - is simply wrong. As we point out in our paper, Douglass et al. reach this incorrect conclusion by ignoring uncertainties in observed and modelled upper air trends arising from interannual variability, and by applying a completely inappropriate "consistency test". Our Figure 5 clearly shows that the Douglass et al. "consistency test" yields incorrect results. The "Addendum" does not suggest that the authors are capable of recognizing or understanding the errors inherent in either their "experimental method" or their "consistency test".

The Douglass et al. IJoC paper reached a radically different conclusion from the conclusions reached by Santer et al. (2005), the 2006 CCSP report, the 2007 IPCC report, and Thorne et al. (2007). It did so on the basis of essentially the same data used in previous work. Most scientists would have asked whether the "consistency test" which yielded such startlingly different conclusions was appropriate. They would have applied this test to synthetic data, to understand its behaviour in a controlled setting. They would have applied alternative tests. They would have done everything they possibly could to examine the robustness of their findings. Douglass et al. did none of these things.

I will ask Leo Haimberger and Peter Thorne to respond to you regarding the first issue raised in the Douglass et al. "Addendum".

Best regards,

Ben Santer

(* In their addendum, Douglass et al. erroneously refer to "ROABCORE" datasets. One would hope that they would at least be able to get the name of the dataset right.)

Tom,

Here's what I sent Kevin yesterday. Still don't have the proofs with Figures in. It is most odd how

this Cambridge seminar has been so widely publicised. Michael McIntyre seems to be sending it everywhere. Dave Thompson is on a sabbatical in the UK for 6 months (at Reading). Should be here soon for a visit to CRU.

The press release is very much work in progress. Appended the latest version at the end. This version still need some work. Maybe I'll get a chance later today.

cc'd Ben as if and when (hopefully) the 'where Douglass et al went wrong' paper comes out a press release then would be useful. In both cases, there is a need to say things in plain English and not the usual way we write.

For some reason the skeptics (CA) are revisiting the Douglass et al paper. A very quick look shows that a number think the paper is wrong!

There is also a head of steam being built up (thanks to a would be Australian astronaut who knows nothing about climate) about the drop in temperature due to La Nina. If you've time look at the HadCRUT3 plot for March08. It was the warmest ever for NH land. The snow cover plots at Rutgers are interesting also. Jan08 for Eurasia had the most coverage ever, but March08 had the least (for their respective months).

It seems we just need the La Nina to finally wind down and the oceans to warm up a little. The press release could be an issue, as it looks as though we are underestimating SST

with the buoys - by about 0.1 deg C.

Cheers

Phil

Using a novel technique to remove the effects of temporary fluctuations in global temperature due to El Niño and transient weather patterns, researchers at Colorado State University, the University of Washington, the UK Met Office and the University of East Anglia have highlighted a number of sudden drops in global temperature.

Most of these drops coincide with the eruptions of large tropical volcanoes and are also evident in air temperatures measured over the worlds land areas, but the largest, occurring towards the end of 1945, is unrelated to any known volcanic eruption and is not apparent over land. It appears to arise from an artificial and temporary cooling caused by an abrupt

change in the mix of US and UK ships reporting temperatures at the end of the Second World War.

The majority of sea temperature measurements available in international data bases between 1941 and 1945 are from US ships. Far fewer data are available in this period than in the 1930s and the 1950s. The crews of US ships measured the temperature of the water before it was used to cool the ships engine. Because of warmth coming from the ship, the water was often a little warmer than the true sea temperature. At the end of 1945 the number of US observations in the data base dropped rapidly. At the same time the number of UK observations increased. UK ships measured the temperature of water samples collected using special buckets. Wind blowing past the buckets as they were hauled onto the deck often caused these measurements to be cooler than the actual sea temperature. The sudden change from US (engine room) to UK (bucket) measurements from warmer to cooler is what caused the abruptness of the drop.

Although the drop in 1945 was large in climate-change terms about 0.3°C its full effect is likely to be limited to the period immediately after the Second World War, because by the 1960s better-insulated buckets were coming into use and there was a more varied mix of measurements from different national merchant shipping fleets. Because it occurs in the middle of the century it will have little effect on 20th Century warming trends, which are corroborated by independent records of air temperatures taken over both land and sea.

Climate researchers at the Met Office Hadley Centre are working to reduce the biases in the temperature datasets. In the past two years, many hundreds of thousands of observations have been keyed in from hand-written log books that were kept aboard ships in the UK navy, particularly for the periods of sparse marine coverage, such as the two World War periods.

Although fixing the drop is unlikely to radically alter our understanding of climate change, having a more accurate record of the real temperature change during the mid-20th century could provide insight into the more subtle mechanisms that caused the early rise in temperatures to the 1920s and the subsequent flattening of the temperature curve that lasted into the early 1970s.

Marine temperatures are much more prone to systematic biases arising from changes in the way the measurements are taken and the platforms used, than are land air temperatures. For example, since the 1970s, sea surface temperatures have been estimated from satellites, but these need considerable adjustment (sometimes in excess of 2 deg C) to be comparable with ship and buoy measurements. The satellite sees only the top millimetre of the ocean surface, while traditional ship-based sampling sees the top few metres. A change is gradually taking place across the world's oceans in the way sea surface temperature measurements are made during the last ten years: the number of ship-based measurements has reduced slightly, but there is a dramatic increase in the number of measurements coming from automatic measurements taken on fixed and drifting buoys. Work is underway to determine the size of the difference between the ships and buoys, as the bias between the two could be of the same order as that in the 1940s.

Kevin,

Odd how far and wide Cambridge seminars are advertised!

Dave Thompson has given this talk at Reading and will be here tomorrow for a similar talk. Here's an email I sent earlier to someone in London.

I'm on the Nature paper - due out end of May/early June.

Attached the draft press release as well.

Any thoughts welcome. I hope you'll see how all this could be misinterpreted!

Cheers

Phil

Chris,

David Thompson is giving a talk here tomorrow on this.

The essence of his talk will be in Nature in a few weeks time.

The skeptics will make a meal of this when it comes out, but if they did their job properly (I know this is impossible!) they would have found it. It relates to a problem with SST data in the late 1940s. The problem will get corrected for at some point. SSTs need adjusting as there must be from buckets for the period from Aug45 by about 0.3 gradually reducing to a zero adjustment by about the mid-1960s. The assumption was that after WW2 they were all intake measurements and didn't need adjusting.

This will reduce the 1940-1970 cooling in NH temps. Explaining the cooling with sulphates won't be quite as necessary. It won't change century-scale trends.

There is much more of an interesting thing going on now. With all the drifters now deployed measuring SST, the % of ships making measurements is now only about 40% of the total - whereas it was all in the late 1990s. In comparisons over the last 10 years it seems that ships measure SSTs about 0.1-0.2 higher than the drifters/buoys. As the 61-90 base period is ship based, it means recent anomalies are colder than they should be (by about 0.1 for global mean T in the last 2 years).

Working on a press release with MOHC about the Nature paper.

We've been through page proofs with Nature, but these don't yet include figs.

I can send these when we get them.

Cheers

Phil

Subject: Talk on Understanding 20th C surface temperature variability

Date: Mon, 28 Apr 2008 12:00:36 +0100 (BST)

From: Leverhulme Climate Symposium [1]<climate@esc.cam.ac.uk>

Reply-To: [2]climate@esc.cam.ac.uk

To: [3]climate@esc.cam.ac.uk

Dear Colleagues,

David Thompson of Colorado State University will be speaking in Cambridge on 22 May on 'Understanding 20th century surface temperature variability'. His talk will 'highlight a glaring but previously overlooked error in the time series of global-mean temperatures', see full abstract below. (For those too far from Cambridge to attend, this is for information and interest).

The prevailing view of 20th century temperature variability is that the Earth warmed from ~1910 to 1940, cooled slightly from ~1940 to 1970, and warmed markedly from ~1970 onward. In this talk I will exploit a physically-based filtering methodology which provides an alternative interpretation of 20th century global-mean temperature variability. The results clarify the consistency between the century- long monotonic rise in greenhouse gases and global-mean temperatures, provide new insights into the climatic impact of volcanic eruptions, and highlight a glaring but previously overlooked error in the time series of global-mean temperatures.

Thursday 22 May, 2.15 pm in Meeting Room 2, Centre for Mathematical Sciences (between Clarkson and Madingley Roads)

Dear Glenn,

This is a little disappointing. We decided to submit our paper to IJoC in order to correct serious scientific errors in the Douglass et al. IJoC paper. We believe that there is some urgency here. Extraordinary claims are being made regarding the scientific value of the Douglass et al. paper, in part by co-authors of that paper. One co-author (S. Fred Singer) has used the findings of Douglass et al. to buttress his argument that "Nature not CO2, rules the climate". The longer such erroneous claims are made without any form of scientific rebuttal, the more harm is caused.

In our communications with Dr. Osborn, we were informed that the review process would be handled as expeditiously as possible. Had I known that it would take nearly two months until we received a complete set of review comments, I would not have submitted our paper to IJoC.

With best regards,

Ben Santer

Dear Grantee:

SUBJECT: REQUEST FOR COST INFORMATION

In accordance with the Presidents Management Agenda, there has been and continues to be a Government-wide movement to ensure that the American people receive better results for their money. Thus, all government entities are striving to improve the quality, accuracy, and timeliness of financial information regarding the results of operations and overall performance. As we seek to accomplish this goal, we are requesting cost data from our Grant recipients that have received significant financial assistance monies from the Department of Energy Office of Science - Chicago Office. The requested information, summarized below, will assist in our continuing efforts to ensure that we produce accurate and timely financial information. We need your assistance in the following areas:

A. Providing Cumulative Cost Data:

For most of the awards administered by the Office of Science - Chicago Office, there is a financial reporting requirement to submit cost data on the Financial Status Report (SF-269) at the end of the project period. Currently, there is no requirement for you to submit cost data on a more frequent basis. However, in order to achieve our goal of improving the quality, accuracy, and timeliness of our financial information, the Departments external independent auditors have insisted that we confirm cumulative cost balances with Grantees that have received significant financial assistance monies at least annually. For each grant award listed, we request that you provide the following:

DOE Grant Award(s) No.

1.

Cumulative actual Cost through March 31, 2008
(from inception of the award):

2.

Your best estimate for costs to be incurred for April through June 30, 2008:

3.

Your best estimate for costs to be incurred for July through September 30, 2008:

We are not requiring a specific or formal format for the requested information. Instead, please e-mail your cost data as requested above for each identified grant award to Catherine Richardson at [5]catherine.richardson@ch.doe.gov. Please direct your comments and/or questions to Ms. Richardson at 630/252-6276.

B. Requesting Advances and Reimbursements:

Consistent with our efforts to improve the Departments financial information, we are reviewing significant unpaid balances on our financial assistance awards as well as any credit balances on the Quarterly Federal Cash Transactions Reports (SF-272) which would indicate a delay between the performance of the work and the requests for reimbursements submitted to us from your organization. The Departments external auditors and other users of financial information are concluding that these unpaid balances may not be used and possibly should be withdrawn. Therefore, we request that you:

- Review your existing procedures for requesting advances and reimbursements from DOE; and
- Ensure that the delay between the performance of work and subsequent reimbursements is as minimal as administratively possible.

If this situation does not apply to your organization, no action is required on your part.

We appreciate your support in this important initiative. If you have any questions, please call Cornell Williams at 630/252-2394 or e-mail him at [6]cornell.williams@ch.doe.gov.

Mike, Ray, Caspar,

A couple of things - don't pass on either.

1. Have seen you're RC bet. Not entirely sure this is the right way to go, but it will drum up some discussion.

Anyway Mike and Caspar have seen me present possible problems with the SST data (in the 1940s/50s and since about 2000). The first of these will appear in Nature on May 29. There should be a News and Views item with this article by Dick Reynolds. The paper concludes by pointing out that SSTs now (or since about 2000, when the effect gets larger) are likely too low. This likely won't get corrected quickly as it really needs more overlap to increase confidence. Bottom line for me is that it appears SSTs now are about 0.1 deg C too cool globally. Issue is that the preponderance of drifters now (which measure SST better but between 0.1 and 0.2 lower than ships) mean anomalies are low relative to the ship-based 1961-90 base.

This also means that the SST base the German modellers used in their runs was likely too warm by a similar amount. This applies to all modellers, reanalyses etc. There will be a lot of discussion of the global T series with people saying we can't even measure it properly now.

The 1940s/50s problem with SSTs (the May 29 paper) also means there will be warmer SSTs for about 10 years. This will move the post-40s cooling to a little later - more in line with higher sulphate aerosol loading in the late 50s and 1960s/70s. The paper doesn't provide a correction. This will come, but will include the addition of loads more British SSTs for WW2, which may very slightly cool the WW2 years. More British SST data have also been digitized for the late 1940s. Budget constraints mean that only about half the RN log books have been digitized. Emphasis has been given to the South Atlantic and Indian Ocean log books.

As an aside, it is unfortunate that there are few in the Pacific. They have digitized all the logbooks of the ships journeys from the Indian Ocean south of Australia and NZ to Seattle for refits. Nice bit of history here - it turns out that most of the ships are US ones the UK got under the Churchill/Roosevelt deal in early 1940. All the RN bases in South Africa, India and Australia didn't have parts for these ships for a few years. So the German group would be stupid to take your bet. There is a likely ongoing negative volcanic event in the offing!

2. You can delete this attachment if you want. Keep this quiet also, but this is the person who is putting in FOI requests for all emails Keith and Tim

have written and received re Ch 6 of AR4. We think we've found a way around this.

I can't wait for the Wengen review to come out with the Appendix showing what that 1990 IPCC Figure was really based on.

The Garnaut review appears to be an Australian version of the Stern Report.

This message will self destruct in 10 seconds!

Cheers

Phil

Hi Ray,

Press release has been being written!

I can't seem to find a meeting to go to when the paper comes out!

Moorea was good - hope you'll be able to get to Athens!

Cheers

Phil

Hi Tom,

I believe NCEP has found that, generally speaking, the AMDAR/MDCRS and radiosonde temperatures are treated in a similar fashion in assimilation. Like radiosonde which has varying performance from vendor to vendor, there are differences in performance between aircraft/series and temperature probes. Brad Ballish just had a paper approved for publication (in BAMS?) that identifies the performance differences between air carriers, aircraft type, and aircraft series. Unfortunately, we only know how the data compare with the model guess, but not necessarily absolute "truth". Hopefully Brad can share his paper with this distribution. Bill Moninger and Ralph Petersen may also have published recent papers on this issue they can share. Ralph has published papers that compare near simultaneously launched of Vaisala RS-92 sondes with ascending/descending B-757 aircraft, showing good data agreement.

One should be mindful of the potential advantages of including AMDAR data as a climate resource in addition to radiosonde.

1. Data has been available in quantity since 1992
2. Data does not have the radiation issue as the TAT probe is shielded
3. Data are available at all local times, nearly 24*7*365, at hundreds of major airports internationally, thereby supporting the climate diurnal temperature problem
4. All NMCs keep databases of individual aircraft bias, based on recent performance of the each aircraft's data verses the model guess. These information would be very useful in considering candidate aircraft for a "climate quality" long term database for AMDAR temperature data

I suspect that the reason why AMDAR data have not been used to track atmospheric change is because no-one in the climate community has ever made an effort to use these data. Availability of radiosonde data in the tropics (e.g. South America and Africa) is problematic. In response,

EUCOS/E-AMDAR has been adding data collection over Africa using Air France, British Airways, and Lufthansa aircraft. I have proposed expanding the U.S. data collection to include the Caribbean and South America regions from United, Delta, Continental, etc, aircraft, but have not received support for this expansion. WMO AMDAR Panel is moving to add additional regional AMDAR Programs in the developing countries, similar to the successful expansion in eastern Asia.

AMDAR data are not a replacement for radiosonde, but these data certainly can add to the climate record if the data are properly processed/QC'd.

Regards,

Dave Helms

Can we meet on Monday to discuss this and hear from Phil what was decided at the London meeting? I'll be in late Monday (waiting for someone to look at my leaking roof) - so maybe early afternoon. I'm going down to London early evening and will be at Chelsea on tuesday. Good to see Saffron is getting some publicity!

Clare

Dear all,

Please find attached the final tender pack for the Environment Agency bid. The tasks have been re-jigged, with the main change being a broadening of flood risk management to flood and coastal erosion risk management (FCERM). This means a wider audience to include all operating authorities, and the best practice guidance required (new Task 11) is now substantial element, to include evaluation of FCERM climate change adaptation, case studies and provision of evidence to help upgrade the FCDPAG3 Supplementary Note.

We have just one week to finish this tender, as it must be posted on Friday 23rd. We are putting together the bid document, which we'll circulate on Monday 19th, but in the meantime, and by the end of Tuesday 20th, I need everyone to send information (as indicated in brackets) to support the following structure:

- + Understanding of the tender
- + Methodology and programme (methodology for tasks / sub-tasks - see below - and timing)
- + Project team, including individual and corporate experience (who you are putting forward, pen portraits, corporate case studies)
- + Financial and commercial (day rates and number of days; please also highlight potential issues with the T&Cs e.g. IPR)
- + Health & Safety, Quality and Environmental Management
- + Appendices (full CVs, limited to 6 pages)

Please send to me and Rob McSweeney. The information I have already e.g. on day rates, core pen portraits etc will go straight into the version we're working on, so no need to re-send.

In terms of tasks (new nos.), the following organisation is suggested based on what has been noted to date:

Task 1 (Inception meeting and reporting) Atkins, supported by lead representatives of partners

Task 2 (Project board meetings) Atkins, supported by lead representatives of partners

Task 3 (Analysis of user needs) Atkins with Tyn@UEA and OUCE, plus Futerra depending on style

Task 4 (Phase 2 programme) Atkins, supported by all

Task 5 (Interpret messages from UKCIP08 projections) CRU, OUCE and Newcastle, with Atkins advice on sectors

Task 6 (Development of business specific projections) Newcastle and CRU, with Atkins advice on policy and ops

Task 7 (Putting UKCIP08 in context) CRU, Newcastle and OUCE

Task 8 (User guidance) Atkins, Tyn@UEA, Futerra

Task 9 (Pilot studies) Atkins, Newcastle, OUCE, Tyn@UEA

Task 10 (Phase 3 programme) Atkins, supported by all

Task 11 (Best Practice Guidance for FCERM) Newcastle and Atkins, with CRU

Task 12 (Awareness raising events) Atkins, key experts, Futerra (perhaps as an option as EA are quite specific here)

Task 13 (Training events) Atkins and Futerra

Note that Futerra is a communications consultancy, specialising in sustainability, who will input on workshops and on the guidance documents.

I'll be in touch again early next week.

Best wishes,

Geoff

Task 1 (Inception meeting and reporting) Atkins, supported by lead representatives of partners

Task 2 (Project board meetings) Atkins, supported by lead representatives of partners

Task 3 (Analysis of user needs) Atkins with Tyn@UEA and OUCE, plus Futerra depending on style

Task 4 (Phase 2 programme) Atkins, supported by all

Task 5 (Interpret messages from UKCIP08 projections) CRU, OUCE and Newcastle, with Atkins advice on sectors

Task 6 (Development of business specific projections) Newcastle and CRU, with Atkins advice on policy and ops

Task 7 (Putting UKCIP08 in context) CRU, Newcastle and OUCE

Task 8 (User guidance) Atkins, Tyn@UEA, Futerra

Task 9 (Pilot studies) Atkins, Newcastle, OUCE, Tyn@UEA

Task 10 (Phase 3 programme) Atkins, supported by all

Task 11 (Best Practice Guidance for FCERM) Newcastle and Atkins, with CRU

Task 12 (Awareness raising events) Atkins, key experts, Futerra (perhaps as an option as EA are quite specific here)

Task 13 (Training events) Atkins and Futerra

Note that Futerra is a communications consultancy, specialising in sustainability, who will input on workshops and on the guidance documents.

I'll be in touch again early next week.

Best wishes,

Geoff

Geoff,

Clare is off to Chelsea - back late tomorrow. We (Clare, Tim and me)

have had a brief meeting. Here are some thoughts and questions we had.

1. Were we going to do two sets of costings?
2. Those involved in UKCIP08 (both doing the work and involved in the SG) have signed confidentiality texts with DEFRA. Not sure how these affect access to the headline messages in the drafts we're going to be looking at over the next few months. Also not sure how these will affect the UKCIP workshops that are coming up before the launch.
3. We then thought about costs for the CRU work. We decided on 25K for all CRU work. At £500 per day this comes to 50 days. We then split this into the tasks: 5 - 5 days, 6 - 5 days, 7 - 30 days, 10/11 - 5 days, which leaves 5 more days for meetings. Assumed the 25K was without travel to the meetings.
4. On CVs and pen portraits. Clare will send one before she leaves. Are what you have for Tim and me OK?
5. Some thoughts on Tasks 6 and 7

Task 6 - assumed this was mostly Newcastle. Tim's work on rainfall extremes could be fed in, and we can do something on non-rainfall variables. Assume also you expect us to do waves, but not sure what we can do. It seems as though sea level has become waves?

Task 7 - assumed here Newcastle (Chris/Hayley) would be doing something on blocking (large-scale variability). Oxford would do the final bit on conceptual representation

of emissions and climate system and sensitivities, so based on GCMs.

This leaves CRU for the other three, which we base mainly on the 11 RCM runs, which we can access through LINK. We could also use ENSEMBLES runs for the others, but these would be RCMs. They seem more relevant for the sorts of scales UKCOP08 is working at.

All just a few thoughts at this time.

Can you send the UKWIR bid that went off, so we have a copy?

Cheers

Phil

At 09:06 16/05/2008, Darch, Geoff J wrote:

Dear all,

Please find attached the final tender pack for the Environment Agency bid. The tasks have been re-jigged, with the main change being a broadening of flood risk management to flood and coastal erosion risk management (FCERM). This means a wider audience to include all operating authorities, and the best practice guidance required (new Task 11) is now substantial element, to include evaluation of FCERM climate change adaptation, case studies and provision of evidence to help upgrade the FCDPAG3 Supplementary Note.

We have just one week to finish this tender, as it must be posted on Friday 23rd. We are putting together the bid document, which we'll circulate on Monday 19th, but in the meantime, and by the end of Tuesday 20th, I need everyone to send information (as indicated in brackets) to support the following structure:

- + Understanding of the tender
- + Methodology and programme (methodology for tasks / sub-tasks - see below - and timing)
- + Project team, including individual and corporate experience (who you are putting forward, pen portraits, corporate case studies)
- + Financial and commercial (day rates and number of days; please also highlight potential issues with the T&Cs e.g. IPR)
- + Health & Safety, Quality and Environmental Management
- + Appendices (full CVs, limited to 6 pages)

Please send to me and Rob McSweeney. The information I have already e.g. on day rates, core pen portraits etc will go straight into the version we're working on, so no need to re-send.

In terms of tasks (new nos.), the following organisation is suggested based on what has been noted to date:

Task 1 (Inception meeting and reporting) Atkins, supported by lead representatives of partners

Task 2 (Project board meetings) Atkins, supported by lead representatives of partners

Task 3 (Analysis of user needs) Atkins with Tyn@UEA and OUCE, plus Futerra depending on style

Task 4 (Phase 2 programme) Atkins, supported by all

Task 5 (Interpret messages from UKCIP08 projections) CRU, OUCE and Newcastle, with Atkins advice on sectors

Task 6 (Development of business specific projections) Newcastle and CRU, with Atkins advice on policy and ops

Task 7 (Putting UKCIP08 in context) CRU, Newcastle and OUCE

Task 8 (User guidance) Atkins, Tyn@UEA, Futerra

Task 9 (Pilot studies) Atkins, Newcastle, OUCE, Tyn@UEA

Task 10 (Phase 3 programme) Atkins, supported by all

Task 11 (Best Practice Guidance for FCERM) Newcastle and Atkins, with CRU

Task 12 (Awareness raising events) Atkins, key experts, Futerra (perhaps as an option as EA are quite specific here)

Task 13 (Training events) Atkins and Futerra

Note that Futerra is a communications consultancy, specialising in sustainability, who will input on workshops and on the guidance documents.

I'll be in touch again early next week.

Best wishes,

Geoff

Cc: Gavin Schmidt <gschmidt@giss.nasa.gov>

Mike, Gavin,

OK - as long as you're not critical and remember the embargo. I'll expect Nature will be sending the paper around later today to the press embargoed till the middle of next week.

Attached is the pdf. This is the final one bar page and volume numbers. Also attached is our latest draft press release. This is likely OK except for the last paragraph which we're still working on. There will also be a News and Views item from Dick Reynolds and a Nature news piece from Quirin Schiermeier. I don't have either of these. I did speak to Quirin on Tuesday and he's also spoke to Dave and John. It took me a while to explain the significance of the paper. I hope to get these later two items before I might have to do any interviews early next week. We have a bank holiday on Monday in the UK. The press release will go out jointly from the Met Office and UEA - not sure exactly when.

Potentially the key issue is the final Nature sentence which alludes to the probable underestimation of SSTs in the last few years. Drifters now measuring SSTs dominate by over 2 to 1 cf ships. Drifters likely measure SSTs about 0.1 to 0.2 deg C cooler than ships, so we could be underestimating SSTs and hence global T. I hope Dick will discuss this more. It also means that the 1961-90 average SST that people use to force/couple with models is slightly too warm. Ship-based SSTs are in decline - lots of issues related to the shipping companies wanting the locations of the ships kept secret, also some minor issues of piracy as well. You might want to talk to Scott Woodruff more about this.

A bit of background. Loads more UK WW2 logs have been digitized and these will be going or have gone into ICOADS. These logs cover the WW2 years as well as the late 1940s up to about 1950. It seems that all of these require bucket corrections. My guess will be that the period from 1945-49 will get raised by up to 0.3 deg C for the SSTs, so about 0.2 for the combined. In digitizing they have concentrated on the South Atlantic/Indian Ocean log books.

[1]http://brohan.org/hadobs/digitised_obs/docs/ and click on SST to see some comparisons.

The periods mentioned here don't seem quite right as more later 1940s logs have also been digitized. There are more log books to digitize for WW2 - they have done about half of those not already done.

If anyone wonders where all the RN ships came from, many of those in the S. Atlantic/indian

oceans were originally US ships. The UK got these through the Churchill/Roosevelt deal in 1939/40.

Occasionally some ships needed repairs and the UK didn't have the major parts, so this will explain the voyages of a few south of OZ and NZ across the Pacific to Seattle and then back into the fray.

ICOADS are looking into a project to adjust/correct all their log books.

Also attaching a ppt from Scott Woodruff. Scott knows who signed this!

If you want me to look through anything then email me.

I have another paper just accepted in JGR coming out on Chinese temps and urbanization. This will also likely cause a stir. I'll send you a copy when I get the proofs from AGU. Some of the paper relates to the 1990 paper and the fraud allegation against Wei-Chyung Wang. Remind me on this in a few weeks if you hear nothing.

Cheers

Phil

PS CRU/Tyndall won a silver medal for our garden at the Chelsea Flower Show - the theme of the show this year was the changing climate and how it affects gardening. Clare Goodess was at the garden on Tuesday. She said she never stopped for her 4 hour stint of talking to the public - only one skeptic. She met the environment minister.

She was talking about the high and low emissions garden. The minister (Phil Woolas) seemed to think that the emissions related to the ability of the plants to extract CO2 from the atmosphere! He'd also not heard of the UHI! Still lots of education needed.

PPS Our web server has found this piece of garbage - so wrong it is unbelievable that Tim Ball wrote a decent paper in Climate Since AD 1500. I sometimes wish I'd never said this about the land stations in an email. Referring to Alex von Storch just shows how up to date he is.

At 20:12 21/05/2008, Michael Mann wrote:

Hi Phil,

Gavin and I have been discussing, we think it will be important for us to do something on the Thompson et al paper as soon as it appears, since its likely that naysayers are going to do their best to put a contrarian slant on this in the blogosphere.

Would you mind giving us an advance copy. We promise to fully respect Nature's embargo (i.e., we wouldn't post any article until the paper goes public) and we don't expect to in any way be critical of the paper. We simply want to do our best to help make sure that the right message is emphasized.

thanks in advance for any help!

mike

Subject: RE: Probabilistic information to inform EA decision making - Draft Bid

Geoff, Rob,

Will you be sending another version around at some time?

I can't recall where the idea of two sets of costings came from.

Here are some more thoughts

Related EA work

Drought work

Jones, P.D., Leadbetter, A., Osborn, T.J. and Bloomfield, J.P., 2006: The impact of climate change on severe droughts: River-flow reconstructions and implied groundwater levels. Science Report: SC040068/SR2, Environment Agency, 58pp.

Wade, S., Jones, P.D. and Osborn, T.J., 2006: The impact of climate change on severe droughts: Implications for decision making. Science Report: SC040068/SR3, Environment Agency, 86pp.

These two bits of work related to historic records of drought on the Eden and the Ouse (Anglian).

Flows were reconstructed on a monthly basis back to 1800, and the disaggregated to daily using months with similar monthly flows in the modern record from the 1960s to the near present. The 200 years of daily flows were then put through water resource system models in the two areas to see how often drought restrictions occurred. The historic record was then perturbed for the future time slices using three different GCMs. The important aspect of this work is that for both regions the perturbed futures were no worse than the historic droughts.

On the Eden some recent droughts were the most severe and on the Ouse they were earlier in the 20th and in the 19th century. So, for all work, it is important to get a better handle on the scale of natural variability within each region.

Task 6 should not just consider the instrumental observations that UKCIP08 has looked at (i.e. since 1961).

This period will very likely cover all temperature extremes (if we forget the very cold ones), but it will be inadequate for rainfall (changes in daily, monthly and seasonal extremes).

The EA

work (above) showed a framework for dealing with the issue with respect to drought. The longer

daily precipitation record has been looked at by Tim Osborn and Douglas Maraun (see attached

pdf). Task emphasizes floods exclusively - maybe this is their responsibility and they leave

droughts up to the companies.

One aspect that we could develop within Task 6 is a simple soil moisture accounting model

using rainfall and PET and a measure of soil amount. The results from this could then be

linked with the heavy rainfall to determine different impacts depending on antecedent conditions and time of year.

CRU's work on Task 7

We will be able to use the 11 RCMs on which the whole of UKCIP08 are based - available through LINK. MOHC have used emulation of these to build up distributions. An important aspect

is to see for seasons and variables how the 11 span the probability domain of all the emulations (where do they sit in the pdfs).

Other GCMs - this should really be RCMs. In the ENSEMBLES project we are comparing trends in reality with trends from ERA-40-forced runs of 15 different RCMs across Europe.

This will be able to show that HadRM3 is within the range of the other RCMs for

measures

of extremes in temperatures and daily and 5-day precipitation amounts. The measures here

are trends (seasonal and annual) over the period from 1961-2000.

This will also show their ability to represent current climate (61-00) not just for the means

and trends, but some extreme measures and their trends. This is also past variability as well, but I suspect they are meaning further back. We will be able to use a HadCM3 simulation with historic forcing since 1500.

Back to other work. CRANIUM is the one to refer to. BETWIXT led to CRANIUM. The other thing to add in somewhere is that the UKCIP08 WG came from EARWIG, so attaching that paper as well. There is nothing else yet.

Jones, PD, Harpham, C and Kilsby, CK, 2008: Perturbing a weather generator using factors

developed from RCM simulations. Int J. Climatol (not yet submitted).

This will get submitted. It shows that the way we are perturbing the WG for UKCIP08 works.

We do this by fitting the WG to the model present. We then perturb by using differences between model future (2080s) and model control. These perturbations are monthly. We then

run the WG and look at the daily variability in the simulations compared to the model future at the daily timescale. It works in the sense that the RCM future run is within the

range the WG simulations.

Whether the RCM future is right is another matter but the WG does what the RCM does.

Hope this helps.

Phil

At 16:56 21/05/2008, Darch, Geoff J wrote:

Phil,

Great. From CRU we need in particular project experience (case studies). At the moment we have CRANIUM, but other relevant ones would be good e.g. BETWIXT, SKCC, EA Drought work. Key is those related to probabilistic scenarios, weather generators, working with users and those with EA or Defra (or CCW) as the client.

Any further thoughts or elaboration of your input would be useful, particularly for Task 7, where it may be best to spell out what you will do.

Do you have any preference for the allocation of days between you, Clare and Tim? Also, do you want to revise your rates (for reference Jim Hall is in at £950, Chris Kilsby at £750)? They should apply until the end of the contract i.e. December 2009 and we are asked whether any discounts are available e.g. over and above a certain number of days, which could be worked in if you increased your rates. However, this is entirely up to

you!

We are still waiting on input from Oxford, Newcastle and Futerra - all promised imminently. It will be a busy day tomorrow!

Many thanks,

Geoff

Subject: Re: Probabilistic information to inform EA decision making - Draft Bid
Geoff, Rob,

I can do some work tomorrow. Can you be a little more specific?

It looks as though you need a lot. Have you got anything from anyone else?

I assume this still has to be all off by the end of Friday.

Cheers

Phil

At 14:15 20/05/2008, McSweeney, Robert wrote:

All,

Attached is an outline draft of the bid. It sets out the information we need to include, some of which is already in place.

Please could you take a look at it and forward any of the outstanding information to Geoff and me, such as

- CVs and pen portraits if you haven't already sent them (NB, CVs are in the Appendix and aren't in the attached document)
- Any relevant (corporate) project experience, case studies, etc
- Thoughts and input to the methodology section (NB, each task has been given a lead group or groups)
- General comments and suggestions

Please send comments and information as soon as you have the opportunity, the deadline is rapidly approaching!

Many thanks,

Rob

Hi Geoff

Like Phil, I've just given this a quick read through and there are only a very few minor comments on the attached.

My main concern is the cost - which I have to say is much higher than I was anticipating. But we are proposing a substantial amount of analysis and work....

Thanks for all your work on this and good luck getting it off tomorrow.

Best wishes, Clare

<x-flowed>

Dr. Douglass:

I assume that you are referring to the Santer et al. paper which has been submitted to the International Journal of Climatology (IJoc). Despite your claims to the contrary, the Santer et al. IJoC paper is not essential reading material in order to understand the arguments advanced by Peter Thorne (in his "News and View" piece on the Allen and Sherwood "Nature Geosciences" article).

I note that you did not have the professional courtesy to provide me with any advance information about your 2007 IJoC paper, which was basically a commentary on previously-published work by myself and my colleagues. Neither I nor any of the authors of those previously-published works (the 2005 Santer et al. Science paper and the 2006 Karl et al. CCSP Report) had the opportunity to review your 2007 IJoC paper prior to its publication - presumably because you specifically requested that we should be excluded from consideration as possible reviewers.

I see no conceivable reason why I should now send you an advance copy of my IJoC paper. Collegiality is not a one-way street, Professor Douglass.

Sincerely,

Dr. Ben Santer

Oh MAN! will this crap ever end??

Well, I will have to properly answer in a couple days when I get a chance digging through emails. I don't recall from the top of my head any specifics about IPCC.

I'm also sorry that you guys have to go through this BS. You all did an outstanding job and the IPCC report certainly reflects that science and literature in an accurate and balanced way.

So long,

Caspar

On May 27, 2008, at 5:03 PM, Tim Osborn wrote:

Dear Caspar,

I hope everything's fine with you.

Our university has received a request, under the UK Freedom of Information law, from someone called David Holland for emails or other documents that you may have sent to us that discuss any matters related to the IPCC assessment process.

We are not sure what our university's response will be, nor have we even checked whether you sent us emails that relate to the IPCC assessment or that we retained any that you may have sent.

However, it would be useful to know your opinion on this matter. In particular, we would like to know whether you consider any emails that you sent to us as confidential.

Sorry to bother you with this,

Tim (cc Keith & Phil)

Dave,

Although requests (1) and (2) are for the IPCC, so irrelevant to UEA, Keith (or you Dave) could say that for (1) Keith didn't get any additional comments in the drafts other than those supplied by IPCC. On (2) Keith should say that he didn't get any papers through the IPCC process.either. I was doing a different chapter from Keith and I didn't get any. What we did get were papers sent to us directly - so not through IPCC, asking us to refer to them in the IPCC chapters. If only Holland knew how the process really worked!! Every faculty member in ENV and all the post docs and most PhDs do, but seemingly not Holland.

So the answers to both (1) and (2) should be directed to IPCC, but Keith should say that he didn't get anything extra that wasn't in the IPCC comments.

As for (3) Tim has asked Caspar, but Caspar is one of the worse responders to emails known. I doubt either he emailed Keith or Keith emailed him related to IPCC.

I think this will be quite easy to respond to once Keith is back.

From looking at these questions and the Climate Audit web site, this all relates to two papers in the journal Climatic Change. I know how Keith and Tim got access to these papers and it was nothing to do with IPCC.

Cheers

Phil

At 23:47 27/05/2008, Tim Osborn wrote:

Dear Dave,

re. David Holland's follow-up requests...

These follow-up questions appear directed more towards Keith than to me. But Keith may be unavailable for a few days due to family illness, so I'll attempt a brief response in case Keith doesn't get a chance to.

Items (1) and (2) concern requests that were made by the IPCC Technical Support Unit (hosted by UCAR in the USA) and any responses would have been sent direct to the IPCC Technical Support Unit, to the email address specified in the quote included in item (2). These requests are, therefore, irrelevant to UEA.

Item (3): we'll send the same enquiry to Ammann as we sent to our other colleagues, and let you know his response.

Item (3) also asks for emails from "the journal Climatic Change that discuss any matters in relation to the IPCC assessment process". I can confirm that I have not received any such emails or other documents. I expect that a similar answer will hold for Keith, since I cannot imagine that the editor of a journal would be contacting us about the IPCC process.

Best wishes

Tim

Ben et al,

Definitely the right response - so agree with Tom.
I have been known to disagree with him, and he's not
always right.

Submit asap !!

Cheers

Phil

At 23:48 27/05/2008, Tom Wigley wrote:

Steve et al.,

Sorry, but I agree with quick submission, but not with giving
anything to Douglass until the paper appears in print.

I guess the reason John likes 1.2 is because it agrees best
with UAH MSU -- which, as we all know, has been inspired by
and blessed by God, and so MUST be right.

Tom.

+++++

Steven Sherwood wrote:

Hi Ben,

I for one am happy with submission pronto, leaving to your
discretion the comments I
sent earlier.

I wouldn't feel too threatened by the likes of Douglass. This paper
will likely be

accepted as is upon resubmission, given the reviews, so why not just
send him a copy too

once it is ready and final.

On a related note I've heard from John Christy who stated his
opposition to the new

Allen+Sherwood article/method (who would've thought). He argues
that Leo's v1.2 dataset

is the "best" version because the later ones are contaminated by
artifacts in ERA-40 due

to Pinatubo. This argument made no sense to me on several levels
(one of which:

Pinatubo erupted almost exactly in the middle of the time period of
interest, thus

should have no impact on any linear trend). But there it is.

SS

On May 27, 2008, at 5:41 PM, Ben Santer wrote:

Dear folks,

I just wanted to alert you to an issue that has arisen in the last few days. As you

probably know, a paper by Robert Allen and Steve Sherwood was published last week in

"Nature Geoscience". Peter Thorne was asked to write a "News and Views" piece

on the Allen and Sherwood paper. Peter's commentary on Allen and Sherwood briefly

referenced our joint International Journal of Climatology (IJoC) paper. Peter discussed

this with me about a month ago, and I saw no problem with including a reference to our

IJoC paper. The reference in Peter's "News and Views" contribution is very general, and

gives absolutely no information on the substance of our IJoC paper.

At the time Peter I discussed this issue, I had high hopes that our IJoC manuscript

would now be very close to publication. I saw no reason why publication of Peter's "News

and Views" piece should cause us any concern. Now, however, it is obvious that David

Douglass has read the "News and Views" piece and wants a copy of our IJoC paper in

advance of its publication - in fact, before a final editorial decision on the paper has

been reached. Dr. Douglass has written to me and to Peter, requesting a copy of our IJoC

paper. In his letter to Peter, Dr. Douglass has claimed that failure to provide him

(Douglass) with a copy of our IJoC paper would contravene the ethics policies of the

journal "Nature".

As you can see from my reply to Dr. Douglass, I feel strongly that we should not give

him an advance copy of our paper. However, I think we should resubmit our revised

manuscript to IJoC as soon as possible. The sooner we receive a final editorial decision

on our paper, the less likely that it is that Dr. Douglass will be able to cause

problems. With your permission, therefore, I'd like to resubmit our revised manuscript

by no later than close of business tomorrow. I've incorporated most of the suggested

changes I've received from you in the past few days. My personal feeling is that we've

now reached the point of diminishing returns, and that it's more important to get the

manuscript resubmitted than to engage in further iterations about relatively minor

details. I will circulate a final version of the revised paper and the response to the reviewers later this evening.

Please let me know if resubmission by C.O.B. tomorrow is not acceptable to you.

With best regards,
Ben

Dear all,

Just to add a bit to Ben's notes. The conceptual problem is how to account for two different types of uncertainty in comparing a single observed trend (with temporal uncertainty) with the average of a bunch of model trends (where the uncertainty is from inter-model differences). The "old" d3 tried to do this, but failed the synthetic data test. The new d3 does this a different way (in the way that the inter-model uncertainty term is quantified). This passes the synthetic data test very well.

The new d3 test differs from DCSP07 only in that it includes in the denominator of the test statistic an observed noise term. This is by far the bigger of the two denominator terms. Ignoring it is very wrong, and this is why the DCSP07 method fails the synthetic data test.

Tom.

Hi Phil,

laughable that CA would claim to have discovered the problem. They would have run off to the Wall Street Journal for an exclusive were that to have been true.

I'll contact Gene about this ASAP. His new email is: generwahl@yahoo.com

talk to you later,

mike

One more addendum:

We still need to be aware that this ignores two sources of uncertainty that will exist in the real world that are not included in Section 6 which is effectively 1 perfect obs and finite number of runs of a perfect model:

1. Imperfect models
2. Observational uncertainty related to dataset construction choices (parametric and structural)

Of course, with the test construct given #1 becomes moot as this is the thing we are testing for with H2. This is definitely not the case for #2 which will be important and is poorly constrained.

For Amplification factors we are either blessed or cursed by the wealth of independent estimates of the observational record. One approach, that I would advocate here because I'm lazy / because its more intuitive* (*=delete as appropriate) is that we can take the obs error term outside the explicit uncertainty calculation by making comparisons to each dataset in turn. However, the alternative approach would be to take the range of dataset estimates, make the necessary poor-mans assumption that this is the 1 sigma or 2 sigma range depending upon how far you think they span the range of possible answers and then incorporate this as an extra term in the denominator to d3. As with the other two it would be orthogonal error so still SQRT of sum of squares. Such an approach would have advantages in terms of universal applicability to other problems where we may have less independent observational estimates, but a drawback in terms of what we should then be using as our observational yardstick in testing H2 (the mean of all estimates, the median, something else?).

Anyway, just a methodological quirk that logically follows if we are worried about ensuring universal applicability of approach which with the increasingly frequent use of CMIP3 archive for these types of applications is something we maybe should be considering. I don't expect us to spend very much time, if any, on this issue as I agree that key is submitting ASAP.

Peter

Mike,

Can you delete any emails you may have had with Keith re AR4?
Keith will do likewise. He's not in at the moment - minor family crisis.

Can you also email Gene and get him to do the same? I don't
have his new email address.

We will be getting Caspar to do likewise.
I see that CA claim they discovered the 1945 problem in the Nature paper!!

Cheers

Phil

Ben,

Hopefully the email to Francis will help to resolve this quickly. It would seem from Tom's email that the new d3 approaches the expected result for largish N. A test ought to do this as Tom says.

You'll need to change the response a little as although you may have misinterpreted Francis, you may not have Rev 1.

Hope this is out of your hair as soon as feasible.

Climate Audit are an odd crowd. McIntyre is claiming that he spotted the problem in 1945 in the marine data - and refers to a blog page from late last year! We were already on to it by then and he didn't really know what he was talking about anyway. Maybe this paper and the various press coverage (especially Dick Reynold's N&V as he spelt it out) will allow them to realize that what is really robust in all this is the land record. I suspect it won't though. One day they may finally realize the concept of effective spatial degrees of freedom. John Christy doesn't understand this!

Cheers

Phil

At 04:46 29/05/2008, you wrote:

Dear folks,

Just wanted to let you know that I did not submit our paper to IJoC. After some discussions that I've had with Tom Wigley and Peter Thorne, I applied our d1*, d2*, and d3* tests to synthetic data, in much the same way that we applied the DCPS07 d* test and our original "paired trends" test (d) to synthetic data. The results are shown in the appended Figure.

Relative to the DCPS07 d* test, our d1*, d2*, and d3* tests of hypothesis H2 yield rejection rates that are substantially closer to theoretical expectations (compare the appended Figure with Figure 5 in our manuscript). As expected, all three tests show a dependence on N (the number of synthetic time series), with rejection rates decreasing to near-asymptotic values as N increases. This is because the estimate of the model-average signal (which appears in the numerator of d1*, d2*, and d3*) has a dependence on N, as does the estimate of $s\{\langle b_m \rangle\}$, the inter-model standard deviation of trends (which appears in the denominator of d2* and d3*).

The worrying thing about the appended Figure is the behavior of d3*. This is the test which we thought Reviewers 1 and 2 were advocating. As you can see, d3* produces rejection rates that are consistently LOWER (by a factor of two or more) than theoretical expectations. We do not wish to be accused by Douglass et al. of devising a

test that makes it very difficult to reject hypothesis H2, even when there is a significant difference between the trends in the model average signal and the 'observational signal'.

So the question is, did we misinterpret the intentions of the Reviewers? Were they indeed advocating a $d3^*$ test of the form which we used? I will try to clarify this point tomorrow with Francis Zwiers (our Reviewer 2).

Recall that our current version of $d3^*$ is defined as follows:

$$d3^* = (b\{o\} - \langle\langle b\{m\}\rangle\rangle) / \sqrt{ (s\{\langle b\{m\}\rangle\} ** 2) + (s\{b\{o\}\} ** 2) }$$

where

$b\{o\}$ = Observed trend

$\langle\langle b\{m\}\rangle\rangle$ = Model average trend

$s\{\langle b\{m\}\rangle\}$ = Inter-model standard deviation of ensemble-mean trends

$s\{b\{o\}\}$ = Standard error of the observed trend (adjusted for autocorrelation effects)

In Francis's comments on our paper, the first term under the square root sign is referred to as "an estimate of the variance of that average" (i.e., of $\langle\langle b\{m\}\rangle\rangle$). It's possible that Francis was referring to $\sigma\{SE\}$, which IS an estimate of the variance of $\langle\langle b\{m\}\rangle\rangle$. If one replaces $s\{\langle b\{m\}\rangle\}$ with $\sigma\{SE\}$ in the equation for $d3^*$, the performance of the $d3^*$ test with synthetic data is (at least for large values of N) very close to theoretical expectations. It's actually even closer to theoretical expectations than the $d2^*$ test shown in the appended Figure (which is already pretty close). I'll produce the "revised $d3^*$ " plot tomorrow...

The bottom line here is that we need to clarify with Francis the exact form of the test he was requesting. The "new" $d3^*$ (with $\sigma\{SE\}$ as the first term under the square root sign) would lead to a simpler interpretation of the problems with the DCPS07 test. It would show that the primary error in DCPS07 was in the neglect of the observational uncertainty term. It would also simplify interpretation of the results from Section 6. I'm sorry about the delay in submission of our manuscript, but this is an important point, and I'd like to understand it fully. I'm still hopeful that we'll be able to submit the paper in the next few days. Many thanks to Tom and Peter for persuading me to pay attention to this issue. It often took a lot of persuasion...

Ben

Hi Tim,

in response to your inquiry about my take on the confidentiality of my email communications with you, Keith or Phil, I have to say that the intent of these emails is to reply or communicate with the individuals on the distribution list, and they are not intended for general 'publication'. If I would consider my texts to potentially get wider dissemination then I would probably have written them in a different style. Having said that, as far as I can remember (and I haven't checked in the records, if they even still exist) I have never written an explicit statement on these messages that would label them strictly confidential.

Not sure if this is of any help, but it seems to me that it reflects our standard way of interaction in the scientific community.

=====

Of buckets and blogs

This last week has been an interesting one for observers of how climate change is covered in the media and online. On Wednesday an interesting paper (Thompson et al) was published in Nature, pointing to a clear artifact in the sea surface temperatures in 1945 and associating it with the changing mix of fleets and measurement techniques at the end of World War II. The mainstream media by and large got the story right - puzzling anomaly tracked down, corrections in progress after a little scientific detective work, consequences minor - even though a few headline writers got a little carried away in equating a specific dip in 1945 ocean temperatures with the more gentle 1940s-1970s cooling that is seen in the land measurements. However, some blog commentaries have gone completely overboard on the implications of this study in ways that are very revealing of their underlying biases.

The best commentary came from John Nielsen-Gammon's new blog where he described very clearly how the uncertainties in data - both the known unknowns and unknown unknowns - get handled in practice (read this and then come back). Stoa, quite sensibly, suggested that it's a bit early to be expressing an opinion on what it all means. But patience is not one of the blogosphere's virtues and so there was no shortage of people extrapolating wildly to support their pet hobbyhorses. This in itself is

not so unusual; despite much advice to the contrary, people (the media and bloggers) tend to weight individual papers that make the news far more highly than the balance of evidence that really underlies assessments like the IPCC. But in this case, the addition of a little knowledge made the usual extravagances a little more scientific-looking and has given it some extra steam.

Like almost all historical climate data, ship-board sea surface temperatures (SST) were not collected with long term climate trends in mind. Thus practices varied enormously among ships and fleets and over time. In the 19th Century, simple wooden buckets would be thrown over the side to collect the water (a non-trivial exercise when a ship is moving, as many novice ocean-going researchers will painfully recall). Later on, special canvas buckets were used, and after WWII, insulated 'buckets' became more standard - though these aren't really buckets in the colloquial sense of the word as the photo shows (pay attention to this because it comes up later).

The thermodynamic properties of each of these buckets are different and so when blending data sources together to get an estimate of the true anomaly, corrections for these biases are needed. For instance, the canvas buckets give a temperature up to 1C cooler in some circumstances (that depend on season and location) than the modern insulated buckets. Insulated buckets have a slight cool bias compared to temperature measurements that are taken at the inlet for water in the engine room which is the most used method at present. Automated buoys which became more common in recent decades tend to be cooler than the engine intake measures as well. The recent IPCC report had a thorough description of these issues (section 3.B.3) fully acknowledging that these corrections were a work in progress.

And that is indeed the case. The collection and digitisation of the ship logbooks is a huge undertaking and continues to add significant amounts of 20th Century and earlier data to the records. This dataset (ICOADS) is continually growing, and the impacts of the bias adjustments are continually being assessed. The biggest transitions in measurements occurred at the beginning of WWII between 1939 and 1941 when the sources of data switched from European fleets to almost exclusively US fleets (and who tended to use engine inlet temperatures rather than canvas buckets). This offset was large and dramatic and was identified more than ten years ago from comparisons of simultaneous measurements of night-time marine air temperatures (NMAT) which did not show such a shift. The experimentally based adjustment to account for the canvas bucket cooling brought the sea

surface temperatures much more into line with the NMAT series (Folland and Parker, 1995). (Note that this reduced the 20th Century trends in SST).

More recent work (for instance, at this workshop in 2005), has focussed on refining the estimates and incorporating new sources of data. For instance, the 1941 shift in the original corrections, was reduced and pushed back to 1939 with the addition of substantial and dominant amounts of US Merchant Marine data (which mostly used engine inlets temperatures).

The version of the data that is currently used in most temperature reconstructions is based on the work of Rayner and colleagues (reported in 2006). In their discussion of remaining issues they state:

Using metadata in the ICOADS it is possible to compare the contributions made by different countries to the marine component of the global temperature curve. Different countries give different advice to their observing fleets concerning how best to measure SST. Breaking the data up into separate countries' contributions shows that the assumption made in deriving the original bucket correction—that is, that the use of uninsulated buckets ended in January 1942—is incorrect. In particular, data gathered by ships recruited by Japan and the Netherlands (not shown) are biased in a way that suggests that these nations were still using uninsulated buckets to obtain SST measurements as late as the 1960s. By contrast, it appears that the United States started the switch to using engine room intake measurements as early as 1920.

They go on to mention the modern buoy problems and the continued need to work out bias corrections for changing engine inlet data as well as minor issues related to the modern insulated buckets. For example, the differences in co-located modern bucket and inlet temperatures are around 0.1 deg C:

(from John Kennedy).

However it is one thing to suspect that biases might remain in a dataset (a sentiment shared by everyone), it is quite another to show that they are really there. The Thompson et al paper does the latter quite effectively by removing variability associated with some known climate modes (including ENSO) and seeing the 1945 anomaly pop out clearly. In doing this in fact, they show that the previous adjustments in the pre-war period were probably ok (though there is substantial additional evidence of that in any case - see the references in Rayner et al, 2006). The

Thompson anomaly seems to coincide strongly with the post-war shift back to a mix of US, UK and Dutch ships, implying that post-war bias corrections are indeed required and significant. This conclusion is not much of a surprise to any of the people working on this since they have been saying it in publications and meetings for years. The issue is of course quantifying and validating the corrections, for which the Thompson analysis might prove useful. The use of canvas buckets by the Dutch, Japanese and some UK ships is most likely to blame, and given the mix of national fleets shown above, this will make a noticeable difference in 1945 up to the early 1960s maybe - the details will depend on the seasonal and areal coverage of those sources compared to the dominant US information. The schematic in the Independent is probably a good first guess at what the change will look like (remember that the ocean changes are constrained by the NMAT record shown above).

So far, so good. The fun for the blog-watchers is what happened next. What could one do to get the story all wrong? First, you could incorrectly assume that scientists working on this must somehow be unaware of the problems (that is belied by the frequent mention of post WWII issues in workshops and papers since at least 2005, but never mind). Next, you could conflate the 'buckets' used in recent decades (as seen in the graphs in Kent et al 2007's discussion of the ICOADS meta-data) with the buckets in the pre-war period (see photo above). If you do make that mistake however, you can extrapolate to get some rather dramatic (if erroneous) conclusions. For instance, that the effect of the 'corrections' would be to halve the SST trend from the 1970s. Gosh! (The mismatch this would create with the independent NMAT data series should not be mentioned). But there is more! You could take the (incorrect) prescription based on the bucket confusion, apply it to the full global temperatures (land included, hmm) and think that this merits a discussion on whether the whole IPCC edifice had been completely undermined (Answer: no). And it goes on - the bucket confusion was pointed out but the complaint switches to the scandal that it wasn't properly explained.

All this shows is wishful thinking overcoming logic. However many times there is a similar rush to judgment that is subsequently showed to be based on nothing, it still adds to the vast array of similar 'evidence' that keeps getting trotted out by by the ill-informed. The excuse that these are just exploratory exercises in what-if thinking wears a little thin when the 'what if' always leads to the same (desired) conclusion. This week's play-by-play was quite revealing on that score.

<x-flowed>

Dear Carl,

This issue is now covered in the version of the manuscript that I sent out on Friday. The d2* and d3* statistics have been removed. The new d1* statistic DOES involve the standard error of the model average trend in the denominator (together with the adjusted standard error of the observed trend; see equation 12 in revised manuscript). The slight irony here is that the new d1* statistic essentially reduces to the old d1* statistic, since the adjusted standard error of the observed trend is substantially larger than the standard error of the model average trend...

With best regards,

Ben

Hi Phil,

This is coming along nicely. I've got 5 very strong supporting letter writers lined up to support your AGU Fellowship nomination (confidentially: Ben Santer, Tom Karl, Jean Jouzel, and Lonnie Thompson have all agreed, waiting to hear back from one more individual, maximum is six letters including mine as nominator).

Meanwhile, if you can pass along the following information that is needed for the nomination package that would be very helpful. thanks in advance!

mike

Selected bibliography

- * Must be no longer than 2 pages.
- * Begin by briefly stating the candidate's total number and types of publications and specifying the number published in AGU journals.
- * Do not just select the most recent publications; choose those that best support your argument for Fellowship.

Curriculum Vitae

- * Must be no longer than 2 pages.
- * List the candidate's name, address, history of employment, degrees, research experience, honors, memberships, and service to the community through committee work, advisory boards, etc.

Hi Phil,

Seems to me that CRU should charge him a fee for the service. He shouldn't be under the assumption that he has the right to demand reports be scanned in for him on a whim. CRU should require reasonable monetary compensation for the labor, effort (and postage!). If this were a colleague acting in good faith, I'd say do it at no cost. But of, course, he's not. He's not interested in the truth here, he's just looking for another way to try to undermine confidence in our science.

Henry's review looks helpful and easy to deal w/. Will be interesting to see the other reviews. I guess you're going to get your moneys' worth out of your scanner,
mike

Subject: Farmer et al 1989

Dear Sir, Can you please send me a pdf of the Farmer et al 1989, cited in Folland and Parker 1995, which, in turn is cited in the IPCC Fourth Assessment Report. Thanks,
Steve McIntyre

Farmer, G., Wigley, T. M. L., Jones, P. D. and Salmon, M., 1989 'Documenting and explaining recent global-mean temperature changes'. Climatic Research Unit, Norwich, Final Report to NERC, UK, Contract GR3/6565 (unpublished)

CRU has just the one copy of this! We've just got a new scanner for a project, so someone here

is going to try this out - and scan the ~150pp. I'm doing this as this is one of the project

reports that I wished I'd written up. It's got all the bucket equations, assessments of the accuracy of the various estimates for the parameters that have to be made. It also includes discussion of the shapes (seasonal cycles) of the residual seasonal cycles you get from different types of buckets prior to WW2 relative to intakes. It also includes a factor

they haven't considered at all yet - ship speed and its changes over time. This turns

out

to important. It has a lot more than Folland and Parker (1995). Doubt it will shut them up for

long - but it will justify your faith in those doing the SST work that we have considered everything

we could think of. We'll also put it up on our web site at the same time.

2. Reviews of the Holocene epic.

Got this today - so a journal still working by post! Here is Henry's review.

Possibly the other two might involve hand-written comments on hard copies.

Will get these scanned when they arrive and send around if necessary.

Dear Phil

I have today posted two referees' reports to you and the verdict of accepted subject to taking account of referees' comments. These two reports do not include the report of Henry Diaz which has just been sent to you directly. Please take his comments into account too.

Dear All (especially Peck!),

Attached are three sets of reviews of the paper - 2 in the pdf file and one in the small doc file.

As you'll be able to see, there isn't that much to do and the reviews have been

good. All three reviewers seem to be in awe of the group! I've had a brief

discussion with Keith as to who should do what. You're all welcome to help

but I only think most of you will need go through the revised version when we get that

out - hopefully asap. John Matthews is still hopeful of a 2008 publication date,

and you'll see we won't be going out for any further reviews - just John checking.

Many of the comments relate to the tree-ring section and Keith will

deal with these. They involve some re-organization and some additional refs

on dendro isotope work.

The coral and isotope sections get praised for organization - so well done!

I'll need some help with the one coral comment on 'vital effects', so can

Janice, Kim and Sandy work on that. I think it only needs a few sentences

and maybe extra refs. I know some of you are in Trieste next week, so maybe

you can work on it there.

I'll work on the documentary section a bit and liaise with Juerg. This shouldn't

involve

much extra work.

I'll also look at the borehole section together with what was in Ch 6 of AR4.

The major bit of new text we need is on the high-res varves and laminated lake records,

so this is why I highlighted Peck. They aren't used in large-area high-freq climate

reconstructions, so emphasis there and to a few key review papers. Is this doable in

the next couple of weeks, Peck? I don't think more than a page or two is required.

Related to the issue of the different proxies use or potential use in high-freq

reconstructions, I'll work on trying to bring that out in the Introduction. I'll

bring out the issues of the maturity of the different proxy disciplines.

Sections 3 and 4 just seem to need some minor wording changes and some clarification - possibly in a revised introduction. We're hoping that Tim

here will be able to do that. Note that although the reviewer suggested dropping

the forcing section, John Matthews would like that kept.

In conclusion, we are nearly there. CRU will be able to find the colour costs

envisaged.

To those in Trieste - enjoy the week and I hope it will as fruitful as Wengen was.

If anyone is going to be out of contact during the second half of June and early July

can you let me know.

I've reattached the submission as a word file.

Cheers

Phil

Hi Phil,

I'm continuing to work on your nomination package (here in my hotel room in Trieste--the weather isn't any good!). If its possible for a case to be too strong, we may have that here! Lonnie is also confirmed as supporting letter writer, along w/ Kevin, Ben, Tom K, and Jean J. (4 of the 5 are already AGU fellows, which I'm told is important! Surprisingly, Ben is not yet, nor am I. But David Thompson is (quite young for one of these). I'm guessing Mike Wallace and Susan Solomon might have had something to do w/ that ;)

Anyway, I wanted to check w/ you on two things:

1. One thing that people sometimes like to know is the maximum value of "N" where "N" is the number of papers an individual authored/co-authored that have more than N citations. N=40 (i.e., an individual has published at least 40 papers that have each been cited at least 40 times) is supposedly an important threshold for admission in the U.S. National Academy of Sciences. I'm guessing your N is significantly greater than that, and it would be nice to cite that if possible. Would you mind figuring out that number and sending--I think it would be useful is really sealing the case.
